Java Security Scott Oaks,2001-05-17 One of Java's most striking claims is that it provides a secure programming environment. Yet despite endless discussion, few people understand precisely what Java's claims mean and how it backs up those claims. If you're a developer, network administrator or anyone else who must understand or work with Java's security mechanisms, Java Security is the in-depth exploration you need. Java Security, 2nd Edition, focuses on the basic platform features of Java that provide security--the class loader, the bytecode verifier, and the security manager--and recent additions to Java that enhance this security model: digital signatures, security providers, and the access controller. The book covers the security model of Java 2, Version 1.3, which is significantly different from that of Java 1.1. It has extensive coverage of the two new important security APIs: JAAS (Java Authentication and Authorization Service) and JSSE (Java Secure Sockets Extension). Java Security, 2nd Edition, will give you a clear understanding of the architecture of Java's security model and how to use that model in both programming and administration. The book is intended primarily for programmers who want to write secure Java applications. However, it is also an excellent resource for system and network administrators who are interested in Java security, particularly those who are interested in assessing the risk of using Java and need to understand how the security model works in order to assess whether or not Java meets their security needs.

The Plant Cytoskeleton: a Key Tool for Agro-Biotechnology Yaroslav B. Blume, W. Vance Baird, Alla I. Yemets, Diego Breviario, 2008-10-23 Essential processes in biology such as cell and nuclear division, development, intracellular transport and physiological response, rely on the perception of environmental and intracellular signals and their transduction to subcellular targets. The mechanisms by which these signals are received by cells and transduced towards the proper targets by cytoskeletal components constitute one of the most important and rapidly developing areas in modern plant biology. In addition, fundamentally important responses of plants to biotic and abiotic factors also involve signalling to and through the cytoskeleton, which helps explain the current interest of biotechnology in this field of fundamental research. Manipulation of cytoskeletal components, the microtubules and microfilaments, had, until recently, not been a priority issue for plant biotechnology. However, given the fundamental role of the cytoskeleton during plant growth and development, the potential for biotechnological applications is immense. The NATO Advanced Research Workshop, "The Plant Cytoskeleton: Genomic and Bioinformatic Tools for Biotechnology and Agriculture" was held in Yalta, Ukraine, from September 19 to 23, 2006 -- which continued the tradition of the first two International Symposia "Plant Cytoskeleton: Molecular Keys for Biotechnology" (Yalta, Ukraine, 1998) and "The Plant Cytoskeleton: functional diversity and biotechnological implications" (Kiev, Ukraine, 2002).

Plant growth-promoting bacteria as key tool for future agriculture: agronomic, molecular and omics approaches José David Flores Félix, Reiner Rincon Rosales, Victor

Manuel Ruiz-Valdiviezo, Clara Ivette Rincon Molina, 2023-11-15 Currently, agriculture is at a crossroads similar to that experienced at the beginning of the last century. The growing need to supply food to global markets and the incipient climate is expected to jeopardize the current agricultural systems. This situation requires a rethinking of agricultural production systems, and it is clearly necessary to incorporate new tools and agronomic practices that improve efficiency and sustainability. A key factor can be identified in using resources or the competition of crops to resist biotic and abiotic stresses. Plant growth-promoting bacteria (PGPB) are of outstanding utility due to the multiple mechanisms with which they influence plant development. It is fundamental, at these crossroads, to delve deeper into the mechanisms by which PGPB can improve the development of plants in the soil at the phenotypic level. Biochemical methods, incorporating genomic, transcriptomic, proteomic, and metabolomic analyses, can help us understand these interactions. In addition, omics techniques will make it possible to create a complete and complex vision using big data technologies, spurring new strategies to achieve an agriculture with a greater degree of integration of the environment, and greater efficiency of production with reduced risk to human.
