Machine Learning Models and Algorithms for Big Data Classification Shan Suthaharan, 2015-10-20

This book presents machine learning models and algorithms to address big data classification problems. Existing machine learning techniques like the decision tree (a hierarchical approach), random forest (an ensemble hierarchical approach), and deep learning (a layered approach) are highly suitable for the system that can handle such problems. This book helps readers, especially students and newcomers to the field of big data and machine learning, to gain a quick understanding of the techniques and technologies; therefore, the theory, examples, and programs (Matlab and R) presented in this book have been simplified, hardcoded, repeated, or spaced for improvements. They provide vehicles to test and understand the complicated concepts of various topics in the field. It is expected that the readers adopt these programs to experiment with the examples, and then modify or write their own programs toward advancing their knowledge for solving more complex and challenging problems. The presentation format of this book focuses on simplicity, readability, and dependability so that both undergraduate and graduate students as well as new researchers, developers, and practitioners in this field can easily trust and grasp the concepts, and learn them effectively. It has been written to reduce the mathematical complexity and help the vast majority of readers to understand the topics and get interested in the field. This book consists of four parts, with the total of 14 chapters. The first part mainly focuses on the topics that are needed to help analyze and understand data and big data. The

second part covers the topics that can explain the systems required for processing big data. The third part presents the topics required to understand and select machine learning techniques to classify big data. Finally, the fourth part concentrates on the topics that explain the scaling-up machine learning, an important solution for modern big data problems.

Communications and Networking in China Patrick Bond,2009-02-01 ChinacomBiz 2008 was the first international business-to-business (B2B) conference held in collaboration with the Chinacom scientific event in Hangzhou, China, on August 28. It was specifically tailored to produce more effective dialogue between the research, technology and business communities on technical developments in China and around the world. The event had industry support via well-know industry names such as the WIFI Alliance, Springer, CREATE-NET and Arris. The main focus of the event was on transport networks and infrastructures, video distribution systems and methods and the associated software systems that tie them all together. A total of 24 authors submitted their papers and a final 11

registrations were accepted. It was an excellent start to the B2B program and feedback was positive from all attendees. The presentations this year originated from the USA, Denmark, Germany, Brazil and of course China, providing the audience with a wide variety of topics and perspectives in all the three categories mentioned above. The presentations from the event are available for download from the website itself (see <http://www.chinacombiz.org/>). Next year's event is already being planned and it will again be collocated with the Chinacom scientific event. We look forward to having another great interaction with science, business and technology from a China perspective. August 2008 Patrick Bond

Intelligent Decision Systems in Large-Scale Distributed Environments Pascal Bouvry, Horacio

González-Vélez, Joanna Kłodziej, 2011-06-19 One of the most challenging issues for the intelligent decision systems is to effectively manage the large-scale complex distributed environments such as computational clouds, grids, ad hoc and P2P networks, under the different types of users, their relations, and real-world uncertainties. In this context the IT resources and services usually belong to different owners (institutions, enterprises, or individuals) and are managed by different administrators. These administrators conform to different sets of rules and configuration directives, and can impose different usage policies on the system users. Additionally, uncertainties are presented in various types of information that are incomplete, imprecise, fragmentary or overloading, which hinders the full and precise determination of the evaluation criteria, their subsequent selection, the assignment scores, and eventually the final integrated decision result. This book presents new ideas, analysis, implementations and evaluation of the next generation intelligent techniques for solving complex decision problems in large-scale distributed systems. In 15 chapters several important formulations of the decision problems in heterogeneous environments are identified and a review of the recent approaches, from game theoretical models and computational intelligent techniques, such as genetic, memetic and evolutionary algorithms, to intelligent multi-agent systems and networking are presented. We believe that this volume will serve as a reference for the students, researchers and industry practitioners working in or are interested in joining interdisciplinary works in the areas of intelligent decision systems using emergent distributed computing paradigms. It will also allow newcomers to grasp key concerns and potential solutions on the selected topics.
