All you need to know about spinning wool--from sheep to knits! Spinners have been creating beautiful yarns from wool for

Topics include:

- An overview of sheep breeds and the characteristics of their fleece
- Washing, carding, combing, and blending fibers
- Purchasing and working with prepared fibers
- Techniques for spinning and plying wool to achieve the right yarn for your projects
- Advice on caring for fibers to protect them from unwanted pests and other problems

Whether you're working with fleeces sheared from your own flock or spinning indie dyed fibers, you'll find a wealth of useful, valuable, and practical information in *The Practical Spinner's Guide: Wool*.

Application of Protective Cultures and Bacteriocins for Food

Biopreservation Riadh Hammami, Ismail Fliss, Aldo

Corsetti, 2019-09-20 The use of microorganisms and their metabolites for the preservation of foods began in prehistory. Lactic acid bacteria are generally recognized as safe (GRAS) for this purpose. They produce organic acids, diacetyl, acetoin, hydrogen peroxide, reuterin, reutericyclin and bacteriocins, all of which inhibit foodborne pathogens and spoilage microorganisms. Bacteriocins and the strains that produce them are particularly effective as bio-preservatives in cheese, meat and vegetables. They hold the promise of ensuring the quality and safety of ready-to-eat, extended-shelf-life, fresh-tasting and minimally processed foods without chemical preservatives. This Research Topic provides an overview of bacterial cultures, bacteriocins and other metabolites that have shown promise for use as antimicrobial bio-preservatives in foods in general. Articles describing novel analytical technologies, strategies to reduce or eliminate pathogens in food

systems or emerging technologies for the production or use of protective cultures or their bacteriocins are presented.

Cancer Cell Signaling David M. Terrian, 2008-02-05 Cells respond to environmental cues through a complex and dynamic network of signaling pathways that normally maintain a critical balance between cellular proliferation, differentiation, senescence, and death. One current research challenge is to identify those aberrations in signal transduction that directly contribute to a loss of this division-limited equilibrium and the progression to malignant transformation. The study of cell-signaling molecules in this context is a central component of cancer research. From the knowledge of such targets, investigators have been able to productively advance many insightful hypotheses about how a particular cancer cell may misinterpret, or respond inappropriately to, growth regulatory cues in their environment. Despite these key insights, the rapidly evolving nature of cell signaling research in cancer has necessitated a continuous revision of these theoretical constructs and the updating of methods used in their study. One contemporary example of the evolution of this field is provided by an analysis of the Human Genome Project data, which reveal a previously unsuspected diversity in the multigene families encoding

for most signaling pathway intermediates. In assessing the usefulness of a particular methodological approach, therefore, we will need to keep in mind that there is a premium on those protocols that can be easily adapted for the analysis of multiple members within a gene family. *Cancer Cell Signaling: Methods and Protocols* brings together several such methods in cell signaling research that are scientifically grounded within the cancer biology field.
