Determining Distance to Lightning Strokes from a Single Station Lothar H. Ruhnke, 1971 A study has been made to use the differences between the decay of electric and magnetic fields near lightning strokes to determine the distance from a single station to the lightning. In our analysis a model of a return stroke is used to compute the waveform of electric and magnetic fields, between 1 km and 100 km distance, and the associated frequency spectrum. At distances small compared with the length of the return stroke channel, the electric field and also the magnetic field decrease inversely with distance from the stroke. From 3 km to 30 km the electric field, when observed at 1 kHz decreases approximately with the cube of the distance, while the magnetic field decreases with the square of the distance. For distances farther than 30 km, both signals decay inversely with distance. On an observation frequency of 1 kHz, it is possible to determine distances to return stroke channels between 3 km to 30 km by using the ratio of magnetic field to electric field. For this range, this ratio is independent of waveform and magnitude of the lightning signal. A prototype instrument was designed and tested during one thunderstorm season. The instrument uses loop antennas for sensing magnetic fields and horizontal wire antennas for sensing the electric field, and contains sharp filters, amplifiers, and peak voltage detectors. For the output, strip chart recorders are used. Data obtained with this instrument verify the predicted possibility of determining from a single

station the distance to lightning strokes.

Calculator Quickies: Patterns, Puzzles, and Problems Susan

Brendel,1995-10-01 Patterns explore unusual number relationships, series and sequences, and squares and square roots. Puzzles include mystery numbers, number tricks, secret numbers, and cross-math puzzles. Problems set in interesting situations have students apply strategies and use calculators appropriately to find solutions.

The Lightning-scene in Ancient Arabic Poetry Ali Ahmad Hussein,2009

In Old Arabic poetry from the pre-Islamic and early Islamic periods to the end of the orthodox Caliphate, one theme is the lightning-scene. In this the protagonist asserts that he could not sleep because he saw lightning flashing far away in the sky. The book explores the various functions of this scene, and its relationship with other parts of the poem. This study achieves two main goals. The first sheds light on two important terms connected with Old Arabic poetry: the function and the narration. We see how a certain element can function differently from text to text, and how these different functions influence the narration of a poem and consequently make it - to some degree - idiosyncratic; i.e., a text that differs from other poems that include the same element. The second purpose is to make a comprehensive study of the components, namely the motifs included in the lightning-scenes. Here, the

author reaches conclusions regarding whether these components differ significantly from text to text, or whether they are merely repetitions. In other words, this study examines whether the lightning-scenes in themselves are idiosyncratic or - on the contrary - are fossilized and conventional follow long-established poetic traditions.

A Comparison of Horizontal Cloud-to-Ground Lightning Flash Distance Using Weather Surveillance Radar and the Distance Between Successive Flashes Method
Christopher Cox, 1999-03-01 On April 29th, 1996 an airman servicing a C-130 aircraft on Huriburt AFB Florida was struck and killed by a lightning flash that traveled an estimated 7 to 10 miles from storms south of the airfield. Ten other workers were injured in the incident. The fatal flash occurred just 8 minutes after the base weather station allowed a lightning advisory to expire. The incident brought to question the adequacy of lightning advisory criteria. Very little research has been done on the horizontal distance that cloud-to-ground lightning flashes occurs from the center of a thunderstorm. This thesis used the WSR-88D method, which used the WSR-88D Algorithm Testing And Display System (WATADS) to calculate the distance from a lightning flash to a thunderstorm centroid. The WSR-88D method was compare with a lightning spatial and temporal clustering method known as the Distance Between Successive Flashes (DBSF) method. This method can use enormous amounts of lightning data, and is well suited to accomplish a climatology of horizontal flash distance from a lightning centroid. For the combined April and July

1996 data used in this thesis, the average percentage of lightning flashes that occurred beyond the 5 nautical mile lightning safety radius outlined in AFOSH 91-100 for both the WSR-88D method and the DBSF method was 30.86%. This result questions the adequacy of the 5 nautical mile lightning safety distance criterion currently being used at most United States Air Force Bases for protection both life and property.

Analyzing Horizontal Distances Between WSR-88D Thunderstorm Centroids and Cloud-to-Ground Lightning Strikes Steve L. Renner, Air Force Institute of Technology (U.S.), 1998-03-01 On April 29, 1996, lightning struck the airfield at Hurlburt Field, FL, killing one Airmen and injuring ten others. This cloud to ground lightning strike hit eight minutes after a lightning advisory was canceled. At the time of the strike, thunderstorms were observed 7 to 10 miles north and south of the airfield. The incident raised questions about Air Force Weather Agency's lightning criteria. Soon after the incident, a Lightning Safety Review Panel was assembled to determine the adequacy of lightning advisories. One of the questions posed to the panel was could an incident like Hurlburt happen again? The review panel could not answer that question due to the lack of documented research on how far lightning can travel horizontally before striking the ground. This thesis used the WSR-88D

Algorithm Testing and Display System (WATADS) and the default parameters of the WATADS's Storm Cell Identification and Tracking (SCIT) Algorithm to identify thunderstorm centroids. Lightning strike data containing nearly 50,000 cloud to ground strikes was obtained through the National Climatic Data Center (NCDC). Horizontal distances were then computed between these storm centroids and cloud to ground lightning strikes. This research discovered that average distances between thunderstorm centroids and lightning strikes vary with season and location. In addition, nearly 75% of all lightning strikes occurred within 10 nautical miles of thunderstorm centroids.

College Algebra Marvin A. Bittinger, Judith A. Beecher, David J. Ellenbogen, Malvin L. Bittinger, Judith A. Penna, Beecher, 2005 With a visual, graphical approach that emphasizes connections among concepts, this text helps students make the most of their study time. The authors show how different mathematical ideas are tied together through their zeros, solutions, and x-intercepts theme; side-by-side algebraic and graphical solutions; calculator screens; and examples and exercises. By continually reinforcing the connections among various mathematical concepts as well as different solution methods, the authors lead students to the ultimate goal of mastery and success in class.

Determining the Horizontal Distance Distribution of Cloud-to-Ground Lightning Tamara L. Parsons, 2000-03-01 This research effort attempted to

quantify what constitutes a safe distance when lightning is present. The method used in this research project groups lightning flashes into clusters using spatial and temporal constraints. However, not all flashes meet the time and distance criteria for clustering and remained outside of tile grouped flashes and as such are identified as isolated flashes. These isolated flashes are outliers in the data set, but are precisely the flashes that prove most dangerous. For this reason not only were the distances between each flash and cluster center studied, but also the distances between each isolated flash and its nearest neighboring flash. Distributions for both distances were studied for the continental U.S. by season. A common safety radius is 5 nautical miles, just less than 9.5 km. For all regions, anywhere from 16% to 35% clustered flashes occurred beyond 9.5 km from the cluster center and 71% to 81% of the isolated flashes occurred at distances beyond 9.5 km from the nearest flash. Cumulative frequency distributions of historical lightning data can be used to find the probability of having lightning at a particular distance. In this way an acceptable level of risk can be determined and then a safe distance found.

Algebra and Trigonometry Marvin A. Bittinger, Judith A. Beecher, David J. Ellenbogen, Judith A. Penna, 2006 With a visual, graphical approach that emphasizes connections among concepts, this text helps students make the most of their study time. The authors show how different mathematical ideas are tied together through their zeros, solutions, and x-intercepts theme; side-

by-side algebraic and graphical solutions; calculator screens; and examples and exercises. By continually reinforcing the connections among various mathematical concepts as well as different solution methods, the authors lead students to the ultimate goal of mastery and success in class.

Night and Low-Light Techniques for Digital Photography Peter

Cope, 2005-12-01 The techniques illustrated in this handbook inspire photographers to take photographs when they would otherwise put their camera away—in low-light and nighttime situations. A comprehensive discussion of color and tone teaches photographers how to change their overall perceptions in low-light environments and adjust their exposure settings and filters to suit a variety of light levels. The most adverse lighting situations are covered, such as floodlit cityscapes, lightning, sunsets, stage shows, and fireworks. Tips on taking advantage of the digital environment's ability to manipulate and enhance low-light images both during and after the photo shoot are offered and technical information on both cameras and the latest software is discussed.
