Mass balancing device for an internal combustion engine ,

A Point Energy and Mass Balance Model of a Snow Cover Eric A. Anderson,1976

Methods of Expressing Mass Unbalance N. C. Schaller,J. M. Lewallen,1963

Three different methods of expressing mass unbalance are presented: (1)force vectors in two planes perpendicular to the axis, (2) principal axis shift and tilt, and (3) force and moment vectors relative to the center of gravity.

Each method is discussed briefly. However, method 3 has been determined to be the more useful in expressing mass unbalance for spacecraft payloads, because: (a) specific payload data, other than center of gravity location, are not required, (b) static unbalance is separated from dynamic unbalance, and (c) convenient comparison to other payload configurations is possible. Since unbalance information is conventionally recorded in two planes perpendicular to the spin axis, a unique conversion operation is presented which allows method 1 to be expressed as method 3.

Source and Sediment Hillert Ibbeken,Ruprecht Schleyer,2013-03-09
Deciphering provenance - this is the study of how far geology, geomorphology and climate of a source, a mountainous area, may be reconstructable from its erosional products released to the sea; from gravel and sand, from silt, sand, clay which recombine to form a new cycle of rocks. The purpose of this book is to give a quantitative picture of both source and sediment and the masses involved in the flux of material; based on a modern case study in Calabria, southern Italy, a mountain range which is part of an active plate margin. High erosion rates in the past (200mm/ka), and dramatic ones at present (1500mm/ka), make the area a powerful source of sediment comparable to orogenic conditions of the geological past. The book presents the first systematic, quantitative and data-bank supported study - here a larger source with small rivers and their sedimentary products - of the complex topic of provenance of terrigenous sediments and related mass balances at an active plate margin. It may serve as an orientation for corresponding research in

other plate tectonic realms.

A Passive Balancer for a Class of Rotating Spacecraft C. William Martz, Carolyn Grantham, 1972 Equations of motion are derived for a flexibly connected dual-spin spacecraft equipped with four pendulumlike passive controllers for mass balance and spin axis control. These equations are constrained and used to determine the conditions required for successful steady-state operation of the controllers with a spinning, rigid-body spacecraft. Generalized controller sizing criteria are derived and related to limiting values of system time constant for an example spacecraft unbalance condition. A generalized real-time computer simulation of a large, slowly spinning rigid-body spacecraft equipped with passive controllers is also presented. Numerical results of this simulation show that passive controllers can successfully balance a class of rotating rigid bodies undergoing large internal mass and inertial disturbances. The ratio of total controller mass to spacecraft mass need not be greater than 1 to 2 percent.
