*Behavioral Genetics of the Fly (Drosophila Melanogaster)* Josh Dubnau, 2014-06-26 The common fruit fly - *Drosophila melanogaster* - has been the subject of genetics research since the early twentieth century. The complete genomic sequence of *Drosophila* was published in 2000 and it is still the model organism par excellence for the experimental study of biological phenomena and processes. It is also by far the best model for studying gene function in mammals, including humans. Presenting state-of-the-art studies on the behaviour of *Drosophila*, this volume discusses normal and pathological models of neurobehavioral disorders and encompasses the specialised methods

that have been used, from anatomical, histological, immunohistological and neurophysiological to genomic, genetic and behavioural assays. A comprehensive and thorough reference, this volume is a valuable resource for students and researchers alike across several disciplines of life sciences, including behavioral genetics, neurogenetics, behavioral neuroscience, molecular biology, evolutionary biology and population biology.

**Gene-Enzyme Systems in Drosophila** W. J. Dickinson, D. T. Sullivan, 2013-06-29 There was a period in the history of modern biology when proteins were thought to be gene products in a rather direct sense. An account of their appearance and disappearance in the course of development and differentiation

thus seemed an appropriate means of describing gene regulation. When RNA was found to be the immediate product of genetic activity, the study of proteins as gene products lost some of its original attraction. Indeed, the development of the powerful method of nucleic acid hybridization aroused the hope that a large array of specific messenger-RNA molecules synthesized during cell differentiation could be individually assayed. The difficulties in the way of such ambitious projects were described in Volume 3 of this series: Nucleic Acid Hybridization in the Study of Cell Differentiation (ed. H. URSPRUNG, 1972). Enzymes are in large measure responsible for cell function. Clearly, their synthesis must be under genetic control. We are convinced that the study of enzyme behavior during development merits much attention, particularly if the work is carried out on a eukaryote that lends itself to genetic and developmental analysis. An impressive amount of genetic information is available on the insect *Drosophila*, and much has been learnt about its development. The giant chromosomes present in several tissues of this insect might well be useful in a continuing analysis of the appearance of specific enzymes and the transcription of the cognate genetic loci.

**Jervis's Insects as Natural Enemies: Practical Perspectives** Ian C.W. Hardy, Eric Wajnberg, 2023-12-11 There has been a dramatic increase in theoretical and practical studies on insect natural enemies over the last decades. The appeal of insect predators and, in particular, parasitoids, as research animals derives from the relative ease with which many species may

be cultured and experimented on in the laboratory, the simple life-cycles of most parasitoid species, and the increasing demand for biological pest control as a key component of the integrated pest management approach. There is now a very substantial literature on insect natural enemies and thus a great need for a general text that enquiring students or research workers can use in deciding on approaches and techniques that are appropriate to the study and evaluation of such insects. This book fulfils that demand. It is a considerably updated and expanded version of a previous best-seller and provides an account of major aspects of the biology of predators and parasitoids, punctuated with information and advice on which experiments or observations to conduct and, importantly, how to carry them out. Guidance is provided, where necessary, on the most recent further literature that may need to be consulted on given topics. While researchers can now refer to several books on parasitoids and predators, Jervis's *Insects as Natural Enemies* is unique in emphasising practicalities. It is aimed at students and professionals working in universities and both government and commercial institutes in the fields of integrated pest management, agriculture, horticulture and forestry, as well as those interested in fundamentals of behavioural, population, community and evolutionary ecology.
