2D Monoelemental Materials (Xenes) and Related Technologies Zongyu

Huang,Xiang Qi,Jianxin Zhong,2022-04-19 Monoelemental 2D materials called Xenes have a graphene-like structure, intra-layer covalent bond, and weak van der Waals forces between layers. Materials composed of different groups of elements have different structures and rich properties, making Xenes materials a potential candidate for the next generation of 2D materials. 2D Monoelemental Materials (Xenes) and Related Technologies: Beyond Graphene describes the structure, properties, and applications of Xenes by classification and section. The first section covers the structure and classification of single-element 2D materials, according to the different main groups of monoelemental materials of different components and includes the properties and applications with detailed description. The second section discusses the structure, properties, and applications of advanced 2D Xenes materials, which are composed of heterogeneous structures, produced by defects, and regulated by the field. Features include: Systematically detailed single element materials according to the main groups of the constituent elements Classification of the most effective and widely studied 2D Xenes materials Expounding upon changes in properties and improvements in applications by different regulation mechanisms Discussion of the significance of 2D single-element materials where structural characteristics are closely combined with different preparation methods and the relevant theoretical properties complement each other with practical applications Aimed at researchers and advanced students in materials science and engineering, this book offers a broad view of current knowledge in the emerging and promising field of 2D monoelemental materials.

Fault-Tolerant Real-Time Systems Stefan Poledna,2007-11-23 Real-time computer systems are very often subject to dependability requirements because of their application areas. Fly-by-wire airplane control systems, control of power plants, industrial process control systems and others are required to continue their function despite faults. Fault-tolerance and real-time requirements thus constitute a kind of natural combination in process control applications. Systematic fault-tolerance is based on redundancy, which is used to mask failures of individual components. The problem of replica determinism is thereby to ensure that replicated components show consistent behavior in the absence of faults. It might seem trivial that, given an identical sequence of inputs, replicated computer systems will produce consistent outputs. Unfortunately, this is not the case. The problem of replica non-determinism and the presentation of its possible solutions is the subject of *Fault-Tolerant Real-Time Systems: The Problem of Replica Determinism*. The field of automotive electronics is an important application area of fault-tolerant real-time systems. Systems like anti-lock braking, engine control, active suspension or vehicle dynamics control have demanding real-time and fault-tolerance requirements. These requirements have to be met even in the presence of very limited resources since cost is extremely important. Because of its interesting properties *Fault-Tolerant Real-Time Systems* gives an introduction to the application area of automotive electronics. The requirements of automotive electronics are a topic of discussion in the remainder of this work and are used as a benchmark to evaluate solutions to the problem of replica determinism.

Discrimination in Elite Public Schools Gary Orfield,Jennifer B. Ayscue,2018 School choice is an increasingly important part of today's educational landscape and this timely volume presents fresh research about the competitive admissions policies of choice

systems. Based on their investigation of a unique civil rights challenge to school choice admissions policies in politically and racially divided Buffalo, New York, and the struggle to open its best schools to students of color, authors Orfield and Ayscue contend that without intentional effort, choice systems are likely to exacerbate problems of inequality and segregation. Focusing on issues that will continue to be contested in the courts and in the policy arena, the authors offer research-based recommendations for reducing barriers to enrollment and for creating competitive-admissions choice systems that will allow all students access to important educational opportunities. The book outlines specific steps school systems can take, including developing a district-wide diversity plan, providing more accessible information, conducting holistic admissions processes, expanding the availability of choices, and offering preparation programs to assist students long excluded from these highly competitive schools. Contributors: Natasha Amlani, Jongyeon Ee, Genevieve Siegel-Hawley, Jenna Tomasello, Brian Woodward “This important book ought to inspire a national debate. I hope it will be widely read.” —Jonathan Kozol, education activist and bestselling author *In the News: Buffalo Parents Slam School District’s Response to Civil Rights Complaint*: “This time around, parents with the District Parent Coordinating Council say that the proposal does not go far enough in addressing their complaints or the recommendations that Orfield proposed earlier this year.” —Excerpt from *Education Week* (10/1/15)

Fundamentals and Sensing Applications of 2D Materials Chandra Sekhar Rout, Dattatray J. Late, Hywel Morgan, 2019-06-15 *Fundamentals and Sensing Applications of 2D Materials* provides a comprehensive understanding of a wide range of 2D materials. Examples of fundamental topics include: defect and vacancy engineering, doping and advantages of 2D materials for sensing, 2D materials and composites for sensing, and 2D materials in biosystems. A wide range of applications are addressed, such as gas sensors based on 2D materials, electrochemical glucose sensors, biosensors (enzymatic and non-enzymatic), and printed, stretchable, wearable and flexible biosensors. Due to their sub-nanometer thickness, 2D materials have a high packing density, thus making them suitable for the fabrication of thin film based sensor devices. Benefiting from their unique physical and chemical properties (e.g. strong mechanical strength, high surface area, unparalleled thermal conductivity, remarkable biocompatibility and ease of functionalization), 2D layered nanomaterials have shown great potential in designing high performance sensor devices. Provides a comprehensive overview of 2D materials systems that are relevant to sensing, including transition metal dichalcogenides, metal oxides, graphene and other 2D materials system. Includes information on potential applications, such as flexible sensors, biosensors, optical sensors, electrochemical sensors, and more. Discusses graphene in terms of the lessons learned from this material for sensing applications and how these lessons can be applied to other 2D materials.

Fuzzy Hardware Abraham Kandel, Gideon Langholz, 1998 Fuzzy hardware developments have been a major force driving the applications of fuzzy set theory and fuzzy logic in both science and engineering. This volume provides the reader with a

comprehensive up-to-date look at recent works describing new innovative developments of fuzzy hardware. An important research trend is the design of improved fuzzy hardware. There is an increasing interest in both analog and digital implementations of fuzzy controllers in particular and fuzzy systems in general. Specialized analog and digital VLSI implementations of fuzzy systems, in the form of dedicated architectures, aim at the highest implementation efficiency. This particular efficiency is asserted in terms of processing speed and silicon utilization. Processing speed in particular has caught the attention of developers of fuzzy hardware and researchers in the field. The volume includes detailed material on a variety of fuzzy hardware related topics such as: Historical review of fuzzy hardware research Fuzzy hardware based on encoded trapezoids Pulse stream techniques for fuzzy hardware Hardware realization of fuzzy neural networks Design of analog neuro-fuzzy systems in CMOS digital technologies Fuzzy controller synthesis method Automatic design of digital and analog neuro-fuzzy controllers Electronic implementation of complex controllers Silicon compilation of fuzzy hardware systems Digital fuzzy hardware processing Parallel processor architecture for real-time fuzzy applications Fuzzy cellular systems Fuzzy Hardware: Architectures and Applications is a technical reference book for researchers, engineers and scientists interested in fuzzy systems in general and in building fuzzy systems in particular.

Manufacturing of Natural Fibre Reinforced Polymer Composites Mohd Sapuan Salit,Mohammad Jawaaid,Nukman Bin Yusoff,M. Enamul Hoque,2015-09-10 Natural fibre composite is an emerging material that has great potential to be used in engineering application. Oil palm, sugar palm, bagasse, coir, banana stem, hemp, jute, sisal, kenaf, roselle, rice husk, betul nut husk and cocoa pod are among the natural fibres reported to be used as reinforcing materials in polymer composites. Natural fibre composites were used in many industries such as automotive, building, furniture, marine and aerospace industries. The advantages of natural fibre composites include low cost, renewable, abundance, light weight, less abrasive and they are suitable to be used in semi or non-structural engineering components. Research on various aspects of natural fibre composites such as characterization, determination of properties and design have been extensively carried out. However, publications that reported on research of manufacture of natural fibre composites are very limited. Specifically, although manufacturing methods of components from natural fibre composites are similar to those of components from conventional fibre composites such as glass, carbon and Kevlar fibres, modification of equipment used for conventional fibre composites may be required. This book fills the gap of knowledge in the field of natural fibre composites for the research community. Among the methods reported that are being used to produce components from natural fibre composites include hand lay-up, compression moulding, filament winding, injection moulding, resin transfer moulding, pultrusion and vacuum bag moulding. This book is also intended to address some research on secondary processing such as machining and laser welding of natural fibre composites. It is hoped that publication of this book will provide the readers new knowledge and understanding on the manufacture of natural fibre composites.

Hardware-Software Co-Design of Embedded Systems F. Balarin, Paolo

Giusto, Attila Jurecska, Claudio Passerone, Ellen Sentovich, Bassam Tabbara, M. Chiodo, Harry Hsieh, Luciano Lavagno, Alberto Sangiovanni-Vincentelli, Kei Suzuki, 2012-12-06 Embedded systems are informally defined as a collection of programmable parts surrounded by ASICs and other standard components, that interact continuously with an environment through sensors and actuators. The programmable parts include micro-controllers and Digital Signal Processors (DSPs). Embedded systems are often used in life-critical situations, where reliability and safety are more important criteria than performance. Today, embedded systems are designed with an ad hoc approach that is heavily based on earlier experience with similar products and on manual design. Use of higher-level languages such as C helps structure the design somewhat, but with increasing complexity it is not sufficient. Formal verification and automatic synthesis of implementations are the surest ways to guarantee safety. Thus, the POLIS system which is a co-design environment for embedded systems is based on a formal model of computation. POLIS was initiated in 1988 as a research project at the University of California at Berkeley and, over the years, grew into a full design methodology with a software system supporting it. Hardware-Software Co-Design of Embedded Systems: The POLIS Approach is intended to give a complete overview of the POLIS system including its formal and algorithmic aspects. Hardware-Software Co-Design of Embedded Systems: The POLIS Approach will be of interest to embedded system designers (automotive electronics, consumer electronics and telecommunications), micro-controller designers, CAD developers and students.

A Voice in the Night Andrea Camilleri, 2016-10-06 A Voice in the Night is the twentieth compelling crime novel in the phenomenally successful Inspector Montalbano series by Andrea Camilleri. Feeling his age, as his birthday rolls round once again, Inspector Montalbano decides to cheer himself up by dealing with a young driver's road rage in his own unique way. But his joy is short-lived, as at police headquarters he receives an angry phone call from a supermarket boss: there's been a robbery at his store and Montalbano's colleague is treating him as a suspect. On arrival at the scene, Montalbano quickly agrees with Inspector Augello that this was no ordinary break-in, but with the supermarket's

infamous links to the Sicilian Mafia creating problems at every turn, this isn't going to be an easy case for the inspector to solve. And to add to the inspector's burden, the young driver he made an enemy of earlier on has returned to police headquarters to report a shocking crime . . . A Voice in the Night is followed by the twenty-first gripping mystery, A Nest of Vipers.
