Maya Character Creation Chris Maraffi, 2003-09-11

A unique, in-depth approach to creating realistic characters in Maya. Maya Character Creation: Modeling and Animation Controls' author, Chris Maraffi, has expertise in the field and in the classroom that translates to the knowledge and solid teaching skills needed to make this book a must-have! The current trend in computer graphics

is greater organic realism. Many of the top-grossing movies today, such as Spiderman, Lord of the Rings, Jurassic Park 3 , and Star Wars Episode 2, all feature realistic 3D characters. There is a major need in the 3D community for educational material that demonstrates detailed techniques for achieving this organic reality. Maya is one of the main packages used on such cutting-edge films, and has an established toolset for creating believable 3D characters. Maya Character Creation: Modeling and Animation Controls is designed to take you through the process of designing, modeling, and setting up animation controls for complex 3D characters. The concepts, techniques, and Maya tools used for each step in the process are presented in each chapter, followed by many hands-on exercises. NURBS, polygon, and subdivision surface modeling techniques are shown for creating the character's skin, and skeleton-based animation controls are covered in detail. You will learn how a character's skin should deform when the skeletal joints and muscles move. Advanced MEL scripted animation controls are also covered extensively.

Applications and Theory of Petri Nets Kees M. van Hee, Kees van Hee, Rüdiger Valk, 2008-05-30 This volume consists of the proceedings of the 29th International Conference on Applications and Theory of Petri Nets and Other Models of Concurrency (PETRI NETS 2008). The Petri Net conferences serve as annual meeting places to discuss the progress in the field of Petri nets and related models of concurrency. They provide a forum for researchers to present and discuss both applications and theoretical developments in this area. Novel tools and substantial enhancements to existing tools can also be presented. In addition, the conferences always welcome a range of invited talks that survey related domains, as well as satellite events such as tutorials and workshops. The 2008 conference had six invited speakers, two advanced tutorials, and four workshops. Detailed information about PETRI NETS 2008 and the related events can be found at <http://ictt.xidian.edu.cn/atpn-acsd2008>. The PETRI NETS 2008 conference was organized by the Institute of Computing Theory and Technology at Xidian University, Xi'an, China, where it took place during June 23-27, 2008. We

would like to express our deep thanks to the Organizing Committee, chaired by Zhenhua Duan, for the time and effort - vested in the conference and for all the help with local organization. Multimedia Modeling, Modeling Multimedia Information And Systems - Proceedings Of The First International Workshop Ahmed Karmouch, 1999-09-24

Multimedia systems result from the merging of the computing, communications and broadcasting industries. This merging has been made possible today by the technical advances in high speed broadband networks, computer desktop workstations, and information storage and compression techniques. Currently, text and image are the predominant forms of information exchanged over the Internet. However, there are clear signs that the situation is rapidly changing with the recent emergence of multimedia applications in the area of education, business, e-commerce and entertainment – resulting, therefore, in increased consumption of network bandwidth and in the creation of a very large volume of information that needs to be processed and stored. This trend has made strong demands on the multimedia modeling research community to develop new semantic models that will further facilitate the creation, representation, manipulation and animation of multimedia content with a better level of granularity than what is possible to achieve with today's multimedia information systems. This volume explores issues associated with multimedia modeling information and systems and presents the current status of work in this field. It covers a

broad range of theoretical, conceptual and practical topics and addresses the needs of a wide audience, including researchers, multimedia systems designers and users of multimedia systems.

Internet-based Control Systems Shuang-Hua

Yang,2011-02-09 The Internet plays a significant and growing role in real-time industrial manufacturing, scheduling and management. A considerable research effort has led to the development of new technologies that make it possible to use the Internet for supervision and control of industrial processes. Internet-based Control Systems addresses the challenges that need to be overcome before the Internet can be beneficially used not only for monitoring of but also remote control industrial plants. New design issues such as requirement specification, architecture selection and user-interface design are dealt with. Irregular data transmission and data loss and, in extreme cases, whole-system instability may result from Internet time-delay; this book guards against such phenomena from both computer science and control engineering perspectives. Security breaches and safety risks in an Internet-based control system could have

very serious consequences and the author gives specific advice for avoiding them. This book is unique in bringing together multiple strands of research, mainly from computer science and control engineering, into an over-arching study of the entire subject. Practical perspectives are explored both through case studies in several chapters and through real applications including:

- robot arm control;
- web-based simulator for a catalytic reactor;
- virtual supervision parameter control of a water tank system;
- model predictive control for a process control unit;
- remote control performance monitoring and maintenance;
- remote control system design and implementation;

Internet-based Control Systems is a useful introduction and guide for researchers in control engineering and computer science and developers of real-time Internet-enabling software. It can also be used for teaching a final year option or elective on Internet-enabled real-time system design, or as an advanced example of real-time software design for graduates.
