PHP на примерах. 2 изд. Кузнецов Максим Валерьевич, 2012 Рассмотрены приемы программирования на PHP, позволяющие разрабатывать современные эффективные Web-приложения. Использованы многочисленные примеры, взятые из реальной практики. Первое издание книги под названием PHP 5 на примерах охватывало только пятую версию языка. Второе издание полностью обновлено и переработано. Рассмотрено взаимодействие PHP-приложений с Web-сервером Apache и СУБД MySQL, извлечение информации с удаленных серверов, взаимодействие с браузером посредством технологии AJAX, использование библиотеки jQuery. Показаны тонкости работы с HTTP-протоколом, нюансы ReWrite-преобразований, особенности применения интеллектуальных агентов на PHP. Приведены примеры защиты Web-приложений, работы с графикой, Flash и PDF-документами, оптимизации кода и решения ряда других важных задач.

*PHP Security & Cracking Puzzles* Maxim Kuznetsov, Igor Simdyanov, 2006 Concentrating on the process of breaking and protecting Web applications written in PHP, this book also considers related Web programming topics such as client technologies (HTML, cookies, JavaScript), application protocols (HTTP, SMTP), SQL query language, and the breaking and protecting of the Apache Web server. Because these techniques can only be achieved by practical work, the book is divided into two parts: one covering the problem (puzzles) and one devoted to solving the problem. Evaluating the main problem for many Web programmers protecting their applications from being hacked—that they think differently than hackers—this book allows the reader to think like a hacker and understand the techniques they use. The accompanying CD-ROM contains distributions of PHP, Apache, and

MySQL for Windows and Linux and the source codes for all of the solutions discussed.

Making Haste from Babylon Nick Bunker, 2010-04-13 At the end of 1618, a blazing green star soared across the night sky over the northern hemisphere. From the Philippines to the Arctic, the comet became a sensation and a symbol, a warning of doom or a promise of salvation. Two years later, as the Pilgrims prepared to sail across the Atlantic on board the Mayflower, the atmosphere remained charged with fear and expectation. Men and women readied themselves for war, pestilence, or divine retribution. Against this background, and amid deep economic depression, the Pilgrims conceived their enterprise of exile. Within a decade, despite crisis and catastrophe, they built a thriving settlement at New Plymouth, based on beaver fur, corn, and cattle. In doing so, they laid the foundations for Massachusetts, New England, and a new nation. Using a wealth of new evidence from landscape, archaeology, and hundreds of overlooked or neglected documents, Nick Bunker gives a vivid and strikingly original account of the Mayflower project and the first decade of the Plymouth Colony. From mercantile London and the rural England of Queen Elizabeth I and King James I to the mountains and rivers of Maine, he weaves a rich narrative that combines religion, politics, money, science, and the sea. The Pilgrims were entrepreneurs as well as evangelicals, political radicals as well as Christian idealists. *Making Haste from Babylon* tells their story in unrivaled depth, from their roots in religious conflict and village strife at home to their final creation of a permanent foothold in America.

Nanoscale Surface Engineering for Ceramic Fuel Cells Young Beom Kim, 2011 Ceramic fuel cell (CFC) is an all-solid-state energy conversion device and usually refers to fuel cells employing solid ceramic electrolytes. The present generation of ceramic fuel cells can be classified into two types according to the electrolytes they use: oxygen ion conducting fuel cells, or solid oxide fuel cells (SOFCs) and proton conducting fuel cells (PCFC or PCOFC). CFCs usually have the highest operating temperature of all fuel cells at about 600~1000oC for reasonably active charge transfer reactions at the electrode-electrolyte interface and ion transport through the electrolyte. This high CFC's operating temperature has limited practical applications. The goal of my Ph.D. research is to minimize the activation losses at the electrode/electrolyte interface by nanoscale engineering to achieve decent performance of ceramic fuel cells at lower operating temperatures (300~500oC). This dissertation has three main nanoscale surface engineering approaches according to the fuel cell components: electrode structure, composite electrolyte structures with thin interlayers, and the fabrication of three-dimensional fuel cell membrane-electrode assemblies (MEAs). We would call the first part of the dissertation as nanoscale electrode structure engineering for ceramic fuel cells. It describes the fabrication and investigation of morphologically stable model electrode structures with well-defined and sharp platinum/yttria stabilized zirconia (YSZ) interfaces to study geometric effects at triple phase boundaries (TPB), which is known as the actual electrochemical reaction site. A nanosphere lithography (NSL) technique using monodispersed silica nanoparticles is employed to deposit nonporous platinum electrodes containing close-packed arrays of circular openings through the underlying YSZ surface. These nano-structured dense Pt array cathodes exhibited better structural integrity and thermal stability at the fuel cell operating temperature of 450~500oC when compared to porous sputtered Pt electrodes. More importantly, electrochemical studies on geometrically well-defined Pt/YSZ sharp interfaces demonstrated that the cathode impedance and cell performance both scale almost linearly

with aerial density of TPB length. These controlled experiments also allowed for the estimation of the area of the electrochemical reaction zone. This information can be used as a platform for designing the electrode structure to maximize the performance of ceramic fuel cells. The second part of the experiment is about electrolyte surface structure engineering by fabricating composite electrolyte structures. This study describes, both theoretically and experimentally, the role of doped ceria cathodic interlayers and their surface grain boundaries in enhancing oxygen incorporation kinetics. Quantum mechanical simulations of oxygen incorporation energetics support the experimental results and indicate a low activation energy of only 0.07eV for yttria-doped ceria (YDC), while the incorporation reaction on YSZ is activated by a significantly higher energy barrier of 0.38eV. For experiments, epitaxial and polycrystalline YDC, gadolinia-doped ceria (GDC) thin films were grown by pulsed laser deposition (PLD) on the cathode side of 300[ $\mu$ m]-thick single crystalline (100) and 100[ $\mu$ m]-thick polycrystalline YSZ substrates, respectively. For the composite electrolyte sample with YDC interlayer, the Oxygen isotope exchange experiment was conducted employing secondary ion mass spectrometry (SIMS) with high spatial resolution (50nm). The surface mapping result of  $^{18}\text{O}/^{16}\text{O}$  shows high activity at surface grain boundary regions indicating that the grain boundary regions are electrochemically active for oxygen incorporation reaction. Fuel cell current-voltage behavior and electrochemical impedance spectroscopy measurements were carried out in the temperature range of 350oC-450oC on both single crystalline and polycrystalline interlayered cells. Results of dc and ac measurements confirm that cathodic resistances of cells with epitaxial doped-cerium oxides (GDC, YDC) layers are lower than that for the YSZ-only control cell. This is attributed to the higher surface exchange coefficient for doped-cerium oxides than for YSZ. Moreover, the role of grain boundary density at the cathode side external surface was investigated on surface-engineered electrode-membrane assemblies (MEA) having different doped-ceria surface grain sizes. MEAs having smaller surface grain size show better cell performance and correspondingly lower electrode interfacial resistance. Electrochemical measurements suggest that doped-ceria grain boundaries at the cathode side contribute to the enhancement of oxygen surface kinetics. These results provide an opportunity and a microstructure design pathway to improve performance of LT-SOFCs by surface engineering with nano-granular, catalytically superior thin doped-ceria cathodic interlayers. Thirdly, as a reaction surface engineering for SOFC, we investigated a novel method for creating a three-dimensional (3-D) fuel cell architecture to enhance fuel cell performance by increasing the area of the electrolyte membrane. The research describes the fabrication and operation of a low temperature 3-D protonically conducting ceramic fuel cell featuring a close packed and free standing crater patterned architecture achieved by nanospherical patterning (NSP) and dry etching techniques. The cell employed conformal layers of yttria-doped barium zirconate (BYZ) anhydrous electrolyte membrane ( $\sim 120\text{nm}$ ) sandwiched between thin ( $\sim 70\text{nm}$ ) sputtered porous Pt electrode layers. The fuel cell structure achieved the highest reported peak power densities up to 186 mW/cm<sup>2</sup> at 450oC using hydrogen as fuel. To further investigate the proton conductivity of the electrolyte, which is BYZ, we studied the effect of crystalline structures on proton conductivity of BYZ thin films. The results showed that the grain boundaries impede the proton transport through the grain boundary and cause extremely high resistance for ionic transport in the film. This experimental result also can provide significant implications in designing proton conducting ceramic fuel cells. All these efforts and investigations were intended to enhance the ceramic fuel cell performance at low operating temperatures (300--500oC) by improving electrode/electrolyte interface electrochemical reactions. We expect to achieve further enhancement when we combine the approaches each other. For example, fabrication of three-dimensional fuel cells with doped-ceria interlayers and composite electrolyte structures with optimized electrode nano-

structures. Investigations are on-going in our laboratory as a future work.

**Advances in Standards and Methodology in Spectrophotometry** C. Burgess, K.D. Mielenz, 2012-12-02 These conference proceedings form a worthy contribution to the literature on spectrometry reviving the tradition begun at the U.S. National Bureau of Standards conferences in the 1970's of holding interdisciplinary conferences on advances in the standardisation and methodology of spectrometry. The papers and poster abstracts presented in this volume maintain the high professional standards of these earlier NBS conferences, providing a basis for further progress in this discipline.
