16th Annual Computer Security Applications Conference (ACSAC '00) ,2000 Annotation Forty-four papers from the December 2000 conference address challenges in the field of information security. The main areas of discussion are intrusion detection, security policy, public key infrastructure, access control, security architecture, e-commerce, and cryptography. Topics include extending Java for package-based access control, policy mediation for multi-enterprise environments, binding identities and attributes using digitally signed certificates, using operating system wrappers to increase the resiliency to commercial firewalls, calculating costs for quality of security service, and the Chinese Remainder Theorem and its application in a high-speed RSA crypto chip. Introductory Computer Forensics Xiaodong Lin,2018-11-10 This textbook provides an introduction to digital forensics, a rapidly evolving field for solving crimes. Beginning with the basic concepts of computer forensics, each of the book's 21 chapters focuses on a particular forensic topic composed of two parts: background knowledge and hands-on experience through practice exercises. Each theoretical or background section concludes with a series of review questions, which are prepared to test students' understanding of the materials, while the practice exercises are intended to afford students the opportunity to apply the concepts introduced in the section on background knowledge. This experience-oriented textbook is meant to assist students in gaining a better understanding of digital forensics through hands-on practice in collecting and preserving digital evidence by completing various exercises. With 20 student-directed, inquiry-based practice exercises, students will better understand digital forensic concepts and learn digital forensic investigation techniques. This textbook is intended for upper undergraduate and graduate-level students who are taking digital-forensic related courses or working in digital forensics research. It can also be used by digital forensics practitioners, IT security analysts, and security engineers working in the IT security industry, particular IT professionals responsible for digital investigation and incident handling or researchers working in these related fields as a reference book.

Human-Computer Interaction - INTERACT '87 H.-J. Bullinger,B. Shackel,2014-05-21 Since the first INTERACT Conference in September 1984, the field of Human-Computer Interaction has received increasing attention from researchers and industrial practitioners, the importance of the topic now being widely recognized. Technological developments have made it possible to seek new solutions to the problem of supporting work processes by information technology and for designing the interface between user and the machine. Computers have become an everyday and common tool in the work of many people. This has motivated the development of an interdisciplinary field of research, which now appears much more established than it was a few years ago. The INTERACT forums provide the opportunity for regular presentation and discussion of new results from research and application by bringing together the various disciplines and research approaches on a worldwide basis.

Computer Graphics Techniques David F. Rogers,Rae Earnshaw,2001-10-31 In the third paper in this chapter, Mike Pratt provides an historical introduction to solid modeling. He presents the development of the three most frequently used techniques: cellular subdivision, constructive solid modeling and boundary representation. Although each of these techniques developed more or less independently, today the designer's needs dictate that a successful system allows access to all of these methods. For example, sculptured surfaces are generally represented using a boundary

representation. However, the design of a complex vehicle generally dictates that a sculptured surface representation is most efficient for the 'skin' while constructive solid geometry representation is most efficient for the internal mechanism. Pratt also discusses the emerging concept of design by 'feature line'. Finally, he addresses the very important problem of data exchange between solid modeling systems and the progress that is being made towards developing an international standard. With the advent of reasonably low cost scientific workstations with reasonable to outstanding graphics capabilities, scientists and engineers are increasingly turning to computer analysis for answers to fundamental questions and to computer graphics for presentation of those answers. Although the current crop of workstations exhibit quite impressive computational capability, they are still not capable of solving many problems in a reasonable time frame, e. g. , executing computational fluid dynamics and finite element codes or generating complex ray traced or radiosity based images. In the sixth chapter Mike Muuss of the U. S.
