Do It Smart Jurgen Ringback,1999-12-22 A decade ago, manufacturing companies had visions of paperless offices, automated plants, and virtual enterprises. But the euphoria quickly evaporated when these visions failed to materialize. Now, from in-depth interviews in a worldwide survey of seventy manufacturing firms, a research team from the prestigious consulting group McKinsey & Company concludes that, far from being a failure, information technology (IT) can be a vital strategic weapon in the manufacturing sector, just as it has proved to be in service industries. In Do IT Smart, experts Rolf-Dieter Kempis and Jürgen Ringbeck along with the McKinsey team identify four cultures of IT users -- stars, big spenders, cautious spenders, and laggards -- based on how efficiently and effectively the users manage IT. The stars stand out because their strong command of IT means they are better able to manage core processes such as R&D, sales and service, and order processing, which in turn produces tangible payoffs in profitability, growth, and market share. From their study of star performers, the authors formulate seven rules for developing a superior IT organization. First, they argue, managers must make IT a top management issue and, second, a priority in product development. IT must be viewed as a strategic tool so that IT strategy can be aligned with business strategy. Clear objectives must be set, and core business processes redesigned. Warning that IT is reaching saturation in administrative applications, the authors describe how it is far more profitable to integrate IT into marketing, sales, and customer service. Finally, they describe how all these elements must be brought together into a lean, customer-oriented IT network. McKinsey's breakthrough study shows that as organizations are increasingly overwhelmed with data, IT will become more of a dividing line between the winners and the losers. IT stars will make quantum leaps in effectiveness, while poor management of IT results in a cost explosion. Managers and information officers who want their business to keep and gain the competitive edge IT offers need this unprecedented insight into how to Do IT Smart.

Culture and Management in the Americas Alfredo Behrens,2009-04-02 Latin Americans are culturally different from North Americans in ways that so far have been inaccurately portrayed in the management literature. In Culture and Management in the Americas, Alfredo Behrens argues that these differences merit a substantial overhaul of management theory and practice to make the best of the significantly untapped Latin American potential for creativity, innovation, and teamwork. This applies in organizations with North American ownership and management, whether they are based in the U.S. or Latin America. Behrens, a management consultant and academic who has studied, taught, and practiced in South and North America and Europe, explains why the use of traditional North American research methods to capture cultural traits in the multi-cultural workforce is inappropriate. This practice produces a false picture of the cultural attributes and capabilities of Latin American managers and key staff. And this, in turn, leads to serious shortcomings in the development of appropriate motivation and leadership strategies and of appraisal and control instruments. Rather than relying on standardized surveys for measuring cultural attributes to underpin and develop such strategies and tools, the author suggests that managers look to the arts—particularly literature and cinema—for a richer and more useful alternative. He illustrates his points by reference to literary icons such as Argentina's Martin Fierro, Brazil's Macunaima, and America's Captain Ahab. He uses a variety of case studies to demonstrate what we can learn from these iconographic characters and what we can expect of each other when we apply these lessons—whether we are leading, following, or working in self-directed teams. This readable and enjoyable book will be an invaluable, engaging, and practical tool for anyone charged with managing at any level in workforce that combines both North American and Latin American cultures.

A Decision Tool to Support Strategy Selection for Software Development Outsourcing Brian Gustav Hermann,2000-06-01 Software development organizations are among an increasing number of companies turning to outsourcing as a strategy to improve cost control, product quality, product development schedule reduction, and focus on core business activities. Outsourcing consultants promise all of these benefits and more, but nearly thirty percent of all outsourcing relationships end in dissatisfaction. In response, several authors have published suggestions for successfully using outsourcing to meet goals. These suggestions are based on anecdotal consulting experience and do not clearly identify whether those experiences are relevant to specific domains or organizational goals. This research effort expands upon the anecdotal software outsourcing literature by employing a broad survey to identify the types of outsourcing strategies, their applicability to specific project scenarios, and their

abilities to achieve project and organizational goals. The specific project scenario variables represent the drivers that determine whether outsourcing strategies are successful. Success is defined in terms of organizational and project goals. The factors and historical experience data were combined to produce a framework and yielded guidelines or rules. The rules, in turn, were used to construct a decision support tool to aid software development project managers and consultants in making their outsourcing strategy decisions for specific projects.

Quantifying Software Capers Jones,2017-10-24 Software is one of the most important products in human history and is widely used by all industries and all countries. It is also one of the most expensive and labor-intensive products in human history. Software also has very poor quality that has caused many major disasters and wasted many millions of dollars. Software is also the target of frequent and increasingly serious cyber-attacks. Among the reasons for these software problems is a chronic lack of reliable quantified data. This reference provides quantified data from many countries and many industries based on about 26,000 projects developed using a variety of methodologies and team experience levels. The data has been gathered between 1970 and 2017, so interesting historical trends are available. Since current average software productivity and quality results are suboptimal, this book focuses on best in class results and shows not only quantified quality and productivity data from best-in-class organizations, but also the technology stacks used to achieve best-in-class results. The overall goal of this book is to encourage the adoption of best-in-class software metrics and best-in-class technology stacks. It does so by providing current data on average software schedules, effort, costs, and quality for several industries and countries. Because productivity and quality vary by technology and size, the book presents quantitative results for applications between 100 function points and 100,000 function points. It shows quality results using defect potential and DRE metrics because the number one cost driver for software is finding and fixing bugs. The book presents data on cost of quality for software projects and discusses technical debt, but that metric is not standardized. Finally, the book includes some data on three years of software maintenance and enhancements as well as some data on total cost of ownership.

The Sourcing of Application Software Services Jens Dibbern,2012-12-06 The field of Information Systems (IS) outsourcing has drawn considerable attention among scientists and practitioners for the past fifteen years. The present book analyses why organizations insource or outsource IS functions - - specifically the development and maintenance of software applications. Concepts from transaction cost theory, resource-based theory, incomplete contracts theory, the theory of planned behaviour, and cross-cultural research are integrated into a coherent framework that recognizes the economic, strategic, and social dimension of the IS sourcing decision. This framework is specified in a research model and empirically tested across countries (Germany versus USA), industries (Machinery versus Finance) and IS functions (Application Software Development versus Maintenance) using the partial least squares (PLS) approach of structural equation modelling. The book thereby provides theoretically and empirically grounded insights into the reasons and implications of the IS sourcing decision.
