Multimedia Security 2 William Puech, 2022-06-21 Today, more than 80% of the data transmitted over networks and archived on our computers, tablets, cell phones or clouds is multimedia data – images, videos, audio, 3D data. The applications of this data range from video games to healthcare, and include computer-aided design, video surveillance and biometrics. It is becoming increasingly urgent to secure this data, not only during transmission and archiving, but also during its retrieval and use. Indeed, in today's all-digital world, it is becoming ever-easier to copy data, view it unrightfully, steal it or falsify it. *Multimedia Security 2* analyzes issues relating to biometrics, protection, integrity and encryption of multimedia data. It also covers aspects such as crypto-compression of images and videos, homomorphic encryption, data hiding in the encrypted domain and secret sharing.

Image and Video Compression and Copyright Protection Lei Yang, 2011 In the embedder, we insert a watermark pattern into video frames according to a watermark payload weighted by the human perceptual model, and transform videos with geometric anti-collusion codes. In the detector, Kanade-Lucas-Tomasi feature tracker is used to register the candidate videos, and the cross-correlation sequence is binarized, ECC decoded and decrypted. This system is very robust to both geometric attacks and collusion attacks, and watermarks are perceptually invisible to human vision system.

Intelligent Video Surveillance Systems Jean-Yves Dufour, 2012-12-14 Belonging to the wider academic field of computer vision, videoanalytics has aroused a phenomenal surge of interest since the current millennium. Video analytics is intended to solve the problem of the incapability of exploiting video streams in realtime for the purpose of detection or anticipation. It involves analyzing the videos using algorithms that detect and track objects of interest over time and that indicate the presence of events or suspect behavior involving these objects. The aims of this book are to highlight the operational attempts of video analytics, to identify possible driving forces behind potential evolutions in years to come, and above all to present the state of the art and the technological hurdles which have yet to be overcome. The need for video surveillance is introduced through two major applications (the security of rail transportation systems and a posteriori investigation). The characteristics of the videos considered are presented through the cameras which enable capture and the compression methods which allow us to transport and store them. Technical topics are then discussed – the analysis of objects of interest (detection, tracking and recognition), “high-level” video analysis, which aims to give a semantic interpretation of the observed scene (events, behaviors, types of content). The book concludes with the problem of performance evaluation.
