Surveillance Valley Yasha Levine, 2018-02-06 The internet is the most effective weapon the government has ever built. In this fascinating book, investigative reporter Yasha Levine uncovers the secret origins of the internet, tracing it back to a Pentagon counterinsurgency surveillance project. A visionary intelligence officer, William Godel, realized that the key to winning the war in Vietnam was not outgunning the enemy, but using new information technology to understand their motives and anticipate their movements. This idea -- using computers to spy on people and groups perceived as a threat, both at home and abroad -- drove ARPA to develop the internet in the 1960s, and continues to be at the heart of the modern internet we all know and use today. As Levine shows, surveillance wasn't something that suddenly appeared on the internet; it was woven into the fabric of the technology. But this isn't just a story about the NSA or other domestic programs run by the government. As the book spins forward in time, Levine examines the private surveillance business that powers tech-industry giants like Google, Facebook, and Amazon, revealing how these companies spy on their users for profit, all while doing double duty as military and intelligence contractors. Levine shows that the military and Silicon Valley are effectively inseparable: a military-digital complex that permeates everything connected to the internet, even coopting and weaponizing the antigovernment privacy movement that sprang up in the wake of Edward Snowden. With deep research, skilled storytelling, and provocative arguments, *Surveillance Valley* will change the way you think about the news -- and the device on which you read it.

Advances on P2P, Parallel, Grid, Cloud and Internet Computing Leonard Barolli, Peter Hellinckx, Juggapong Natwichai, 2019-10-19 This book presents the latest research findings, innovative research results, methods and development techniques related to P2P, grid, cloud and Internet computing from both theoretical and practical perspectives. It also reveals the synergies among such large-scale computing paradigms. P2P, grid, cloud and Internet computing technologies have rapidly become established as breakthrough paradigms for solving complex problems by enabling aggregation and sharing of an increasing variety of distributed computational resources at large scale. Grid computing originated as a paradigm for high-performance computing, as an alternative to expensive supercomputers through different forms of large-scale distributed computing. P2P computing emerged as a new paradigm after client-server and web-based computing and has proved useful in the development of social networking, B2B (business to business), B2C (business to consumer), B2G (business to government), and B2E (business to employee). Cloud computing has been defined as a "computing paradigm where the boundaries of computing are determined by economic rationale rather than technical limits," and it has fast become a computing paradigm with applicability and adoption in all application domains and which provides utility computing at a large scale. Lastly, Internet computing is the basis of any large-scale distributed computing paradigms; it has developed into a vast area of flourishing fields with enormous impact on today's information societies, and serving as a universal platform comprising a large variety of computing forms such as grid, P2P, cloud and mobile computing.

Putting Knowledge to Work and Letting Information Play Timothy W. Luke, Jeremy Hunsinger, 2012-09-22 These collected papers are critical reflections about the rapid digitalization of discourse and culture. This disruptive change in communicative interaction has swept rapidly through major universities, nation states, learned disciplines, leading businesses, and government agencies during the past decade. To commemorate the tenth anniversary of the Center for Digital Discourse and Culture (CDDC) at Virginia Tech, which has been a pioneering leader for many of these changes in university settings, the contributors to this volume examine the transformative implications of digitalizing discourse and culture inside and outside of the academic arena. These technologies of digitalization have created new communities of users, which are highly engaged with their new communicative possibilities, informational content, and discursive forms. Few have asked what these changes will mean, and many of the most important voices engaged in debates about this critical transformation are gathered here in this volume. Each author in his or her own way considers what accepting digital discourse and informational culture now means for contemporary economies, governments, and societies.

Semantic Digital Libraries Sebastian Ryszard Kruk, Bill McDaniel, 2008-10-08 Libraries have always been an inspiration for the standards and technologies developed by semantic web activities. However, except for the Dublin Core specification, semantic web and social networking technologies have not been widely adopted and further developed by major digital library initiatives and projects. Yet semantic technologies offer a new level of flexibility, interoperability, and relationships for digital repositories. Kruk and McDaniel present semantic web-related aspects of current digital library activities, and introduce their functionality; they show examples ranging from general architectural descriptions to detailed usages of specific ontologies, and thus stimulate the awareness of researchers, engineers, and potential users of those technologies. Their presentation is completed by chapters on existing prototype systems such as JeromeDL, BRICKS, and Greenstone, as well as a look into the possible future of semantic digital libraries. This book is aimed at researchers and graduate students in areas like digital libraries, the semantic web, social networks, and information retrieval. This audience will benefit from detailed descriptions of both today's possibilities and also the shortcomings of applying semantic web technologies to large digital repositories of often unstructured data.
