**Solar Thermal Energy Utilization** Manfred Becker,2013-11-11 The energy crisis in 1973 and 1979 initiated a great number of activities and programs for low and high temperature application of solar energy. Synthetic fuels and chemicals produced by solar energy is one of them, where temperatures in the range of 600-1000°C or even higher are needed. In principle such high temperatures can be produced in solar towers. For electricity production, the feasibility and operation of solar tower plants has been examined during the SSPS - project (Small Solar Power System) in Almeria, Spain. The objective of Solar Thermal Energy Utilization is to extend the experience from the former SSPS - program in to the field of solar produced synthetic fuels. New

materials and technologies have to be developed in order to research this goal. Metallic components now in use for solar receivers need to be improved with respect to transient operation or possibly replaced by ceramics. High temperature processes, like steam-methane reforming, coal conversion and hydrogen production need to be developed or at least adapted for the unconventional solar operation. Therefore Solar Thermal Energy Utilization is a long term program, which needs time for its development much more time than the intervals expected in between further energy crisis. The Studies on Technology and Application on Solar Energy Utilization is a necessary step in the right direction in order to prepare for the energy problems in the future.
