There are varying explanations of how and why stretch marks are formed. 1. Stretch marks or striae, are caused when the middle layer of the skin or the dermis is torn allowing the inner layers to show through. This happens when the skin's elasticity breaks down. The stretching causes the connective tissue to break down leading to inflammation. There is microscopic bleeding that shows up as red or purple and later scarring. It is the scars that cause the marks. When the under layer stretches the epidermis also stretches and allows the layer underneath to be visible. They take the form of long, narrow streaks or lines that develop on the surface of the skin. Stretch Marks Chad Bruno,2024-02-05 Strains, or stretch marks, are a frequent form of scarring that can emerge on the skin's surface. Discolorations can range in tone from pink or red to purple or brown, and can appear as elevated or depressed streaks or lines. Although stretch marks can appear anywhere on the body, they most frequently appear on the stomach, upper legs, hips, breasts, and arms. Stretch marks are caused by the stretching of the skin beyond its usual boundaries. Several things might cause this stretching, including: - Stretch marks can appear when the skin is unable to expand and contract at the same rate as the body, which can happen during puberty and pregnancy. - Excessive weight gain can cause skin to stretch, especially if the weight is gained rapidly. - Rapid muscular growth or bodybuilding can also cause stretch marks because the skin is stretched by the underlying muscles. - Use of Corticosteroids: Topical or oral corticosteroid use over an extended period of time might decrease the skin's suppleness, increasing the risk of stretch marks. - Puberty and other hormonal shifts, as well as some medical problems, might alter the skin's capacity to expand without tearing or scarring. Stretch marks are a cosmetic issue for some people despite the fact that they are completely safe and offer no health hazards. Over time, they tend to diminish in color, becoming less prominent. The effectiveness of the many stretch mark creams, lotions, and treatments that claim to lessen their visibility varies. These treatments may lessen the visibility of stretch marks, but they won't get rid of them entirely. Stretch marks can fade or even disappear completely with time with good treatment and hydration.

**Percutaneous Collagen Induction With Microneedling** Emerson Lima, Mariana Lima, 2020-10-29 Percutaneous Collagen Induction with Microneedling is a minimally invasive technique widely used to treat numerous dermatologic conditions such as facial and body scars, melasma, wrinkles, skin laxity, stretch marks, alopecies, vitiligo and scleroderma. Microneedling can also be used to optimize transdermal drug delivery for many substances. This technique uses modern microneedling devices containing multiple fine needles, typically 0.5 to 2.5 mm in length, which are mounted on a barrel and rolled onto the skin to create numerous perforations into the stratum corneum and the papillary dermis. These micro-wounds initiate the release of growth factors, triggering collagen and elastin formation, which results in dermal remodeling and skin resurfacing. This book provides a step-by-step approach to microneedling, based on the authors' more than ten years of experience with the technique, during which they have treated more than

3,000 patients in Brazil for numerous dermatologic conditions. Richly illustrated throughout, it includes over 400 illustrations.
