Security and Privacy in User Modeling J. Schreck, 2013-03-14 User-adaptive (or personalized) systems take individual characteristics of their current users into account and adapt their behavior accordingly. Several empirical studies demonstrate their benefits in areas like education and training, online help for complex software, dynamic information delivery, provision of computer access to people with disabilities, and to some extent information retrieval. Recently, personalized systems have also started to appear on the World Wide Web where they are primarily used for customer relationship management. The aim hereby is to provide value to customers by serving them as individuals and by offering them a unique personal relationship with the business. Studies show that web visitors indeed spend considerably more time at personalized than at regular portals and view considerably more web pages. Personalized sites in general also draw more visitors and turn more visitors into buyers. Personalization therefore would look like a win-win technology for both consumers and online businesses. However, it has a major downside: in order to be able to exhibit personalized behavior, user-adaptive systems have to collect considerable amounts of personal data and lay them in stock for possible future usage. Moreover, the collection of information about the user is often performed in a relatively inconspicuous manner (such as by monitoring users' web navigation behavior), in order not to distract users from their tasks.
