One-dimensional Water Flow Through Snow Samuel C. Colbeck, 1971 A theory is developed to describe the percolation of water through isothermal snow with a vertical porosity gradient. While the necessary laboratory experiments have not been done for snow, concepts from the general theory of two phase flow through porous media are used in the development. The general solution for the one-dimensional problem is given, which, when combined with any periodic boundary condition, can be used to make quantitative predictions. The theory is applied to water percolation through firn on the upper Seward Glacier. Using appropriate values for the parameters, theory shows a wave of volume flux which travels down into the firn and develops features similar to those observed by Sharp. These include an initially symmetric wave which distorts with depth, continuous (rather than intermittent) downward flow beneath the surface, and a decreasing value for the wave crest with depth. The theory predicts that the waves advance with a shock front which grows with depth. The shock front is thought to be only an approximation to the actual physical process. (Author).

Farthest North Fridtjof Nansen, 2000-05-12 In 1893 Nansen set sail in the *Fram*, a ship specially designed and built to be frozen into the polar ice cap, withstand its crushing pressures, and travel with the sea's drift closer to the North Pole than anyone had ever gone before. Experts said such a ship couldn't be built and that the voyage was tantamount to suicide. This brilliant first-person account, originally published in 1897, marks the beginning of the modern age of exploration. Nansen vividly describes the dangerous voyage and his 15-month-long dash to the North Pole by sledge. An unforgettable tale and a must-read for any armchair explorer.
