Roll-Out and Turn-Off Display Software for Integrated Display System National Aeronautics and Space Adm Nasa,2018-09-20 This report describes the software products, system architectures and operational procedures developed by Lockheed-Martin in support of the Roll-Out and Turn-Off (ROTO) sub-element of the Low Visibility Landing and Surface Operations (LVLASO) program at the NASA Langley Research Center. The ROTO portion of this program focuses on developing technologies that aid pilots in the task of managing the deceleration of an aircraft to a pre-selected exit taxiway. This report focuses on software that produces a system of redundant deceleration cues for a pilot during the landing roll-out, and presents these cues on a head up display (HUD). The software also produces symbology for aircraft operational phases involving cruise flight, approach, takeoff, and go-around. The algorithms and data sources used to compute the deceleration guidance and generate the displays are discussed. Examples of the display formats and symbology options are presented. Logic diagrams describing the design of the ROTO software module are also given.Johnson, Edward J., Jr. and Hyer, Paul V.Langley Research CenterSOFTWARE ENGINEERING; COMPUTER PROGRAMS; COMPUTER PROGRAMMING; ALGORITHMS; DISPLAY DEVICES; DECELERATION; CUES; AIRCRAFT PILOTS; FLIGHT TESTS; FLIGHT SIMULATION; SYSTEMS ENGINEERING

An Evaluation of the VISION Execution System Demonstration Prototypes Patricia M. Boren,Rand Corporation,1991 This report describes the prototype development for a U.S. Army combat-oriented logistics execution system with VISION (Visibility of Support Options). The Army calls this system the Readiness-Based Maintenance System (RBMS). RBMS prioritizes repair and distribution of spare parts by maximizing the probability of meeting unit-level weapon system availability goals. The report discusses the feasibility, effectiveness, and usability of RBMS through the use of analytic demonstration prototypes. It outlines the methodology behind RBMS and describes the outputs it produces. It then presents findings on RBMS's potential value for the Army, describes the input data requirements and the availability of usable data in present Army data systems, and discusses evaluation results of the demonstration prototypes. Finally, the report presents prospective users' evaluations of the perceived usefulness of the system and suggestions for its improvement.

Using the Architecture Tradeoff Analysis Method to Evaluate a Wargame Simulation System Lawrence G. Jones,2001 Abstract: The software architecture of a software-intensive system greatly determines system quality. When used appropriately, software architecture evaluations can have a favorable effect on a delivered or modified government system. This technical note describes the application of the Architecture Tradeoff Analysis Method[superscript SM] (ATAM[superscript SM]) to a major wargaming simulation system. A government-contractor team is developing the Wargame 2000 system at the Joint National Integration Center (formerly known as the Joint National Test Facility [JNTF]), Colorado. In this technical note, we present the contextual background about the software architecture, the organization, and the system being evaluated. Next, we present a general overview of the ATAM process. Finally, we describe the application of the ATAM to the Wargame 2000 system and present important results and benefits. While architecture evaluation is valuable early in the development life cycle, this case study illustrates that such evaluations are also useful when a system is well into development.

Human Factors Evaluation of a Heliborne Electronic Warfare System (AN/ALQ-151, Quick Fix) Edwin R. Smutz,1978 The AN/ALQ-151, Quick Fix system is a recently developed, special-purpose electronic warfare (EW) system that is configured in an UH-1H helicopter. The system has an electronic countermeasures capability that enables it to interfere with enemy radio transmissions and an electronic-surveillance capability that can be used to interrupt and determine the location of enemy emitters. Any military system should be made as effective as possible because of the high stakes involved in an armed conflict. It is even more important, however, that an airborne EW system be as effective as possible because of the limited time it can be in operation because of its vulnerability and fuel limitations. To insure maximum effectiveness in the Quick Fix system, the human factors evaluation presented in this report was conducted while Quick Fix was undergoing an Operational Test II by TCATA at Fort Hood, Tex. The purpose of the research was to identify any man-machine interface problems that might reduce the effectiveness of the system and to develop changes in hardware design, operating procedures, and training programs to optimize the effectiveness of the system. In addition to improving the Quick Fix system, the results of

this report can be used to improve the design of similar systems in the future. (Author).

  System Controller Hardware and Embedded Software for the Petite Amateur Navy Satellite (PANSAT) James Anthony Horning,Naval Postgraduate School (U.S.),1997-09-01 This thesis documents the design of the hardware and embedded software of a digital computer that provides autonomous control of the PANSAT spacecraft. The system was designed for use during a two year mission in a low earth orbit. The computer uses an Intel M80C186XL running at 7.3728 MHz, 512 kbytes of error-detection and correction RAM, 64 kbytes of ROM, and standard CMOS components to provide a general purpose microcomputer. The purpose of the computer is to control all subsystems of the spacecraft, perform analog-to- digital conversions, orchestrate duplicate hardware components to provide redundancy, and upload new software from a ground station. The hardware system was built on printed circuit boards which were manufactured by the Space System Academic Group and tested for proper operation. The embedded software was coded using 80186 Assembler and the C programming language, tested for proper operation, and placed into ROM as firmware.

  Re-engineering Portabililty of the Computer Aided Prototyping System (CAPS) Recep Erdinc Yetkin,1997 The Computer-Aided Prototyping System (CAPS) currently runs only on SPARC workstations ruling SunOS version 4.1.3. This limits the usefulness of CAPS, since Sun Microsystems has publicly announced that they have no interest in continuing support for SunOS version 4.x. A solution to this problem is to port CAPS to a PC platform running the Linux operating system. Towards this end, the graphical editor portion of CAPS was ported onto a 100Mhz Pentium, with 32 MB of RAM, Linux 3.0, running Motif 2.0 on X windows. Modifications to both, the Makefile and the graphical editor source code were required for a successful compilation. These modifications were items such as having to compile using various compilers, providing pointers to the Motif and X windows Libraries needed to produce the static builds of the graphical editor, and a number of recompilations of the Linux kernel. As a result of these efforts, the graphical editor, a functional component of CAPS, was successfully ported to this system. The software database, project control and execution support components still remain to be ported as a future development.

Cloud Storage Forensics Darren Quick,Ben Martini,Raymond Choo,2013-11-16 To reduce the risk of digital forensic evidence being called into question in judicial proceedings, it is important to have a rigorous methodology and set of procedures for conducting digital forensic investigations and examinations. Digital forensic investigation in the cloud computing environment, however, is in infancy due to the comparatively recent prevalence of cloud computing. Cloud Storage Forensics presents the first evidence-based cloud forensic framework. Using three popular cloud storage services and one private cloud storage service as case studies, the authors show you how their framework can be used to undertake research into the data remnants on both cloud storage servers and client devices when a user undertakes a variety of methods to store, upload, and access data in the cloud. By determining the data remnants on client devices, you gain a better understanding of the types of terrestrial artifacts that are likely to remain at the Identification stage of an investigation. Once it is determined that a cloud storage service account has potential evidence of relevance to an investigation, you can communicate this to legal liaison points within service providers to enable them to respond and secure evidence in a timely manner. Learn to use the methodology and tools from the first evidenced-based cloud forensic framework Case studies provide detailed tools for analysis of cloud storage devices using popular cloud storage services Includes coverage of the legal implications of cloud storage forensic investigations Discussion of the future evolution of cloud storage and its impact on digital forensics
