Build Breakthrough Performance into Any SOA or Advanced Computing Application To meet unprecedented demand, IT organizations must improve application performance by an order of magnitude. Improving performance is even more crucial in SOA environments, which demand far more computing power than older architectures. Today's multi-core servers can deliver the performance businesses require, but few applications take full advantage of them. Now, software innovator Cory Isaacson introduces an easier, more flexible approach to parallel processing—one that any IT organization can use to attain unprecedented levels of performance. Isaacson shows how Software Pipeline models can help you scale applications to any level required, maximize resources, deliver on challenging objectives, and achieve unprecedented ROI. He illuminates these techniques with real-life business scenarios and proven design patterns—everything architects, analysts, and developers need to start using them immediately. This book's in-depth coverage includes How Software Pipelines work, what they can accomplish, and how you can apply them using the Software Pipelines Optimization Cycle (SPOC) Scaling applications via parallel processing while guaranteeing order of processing in mission-critical applications Solving performance problems in existing applications, and resolving bottlenecks in existing processes A complete, easy-to-adapt Pipelines Reference Framework Detailed code examples reflecting proven Pipelines Patterns Techniques that can be applied in any industry, with any programming language Specific architectural and design solutions for common business and technical challenges The future of Software Pipelines: emerging opportunities for “greenfield” development Tools, sample templates, and source code at [www.informit.com/title/0137137974](http://www.informit.com/title/0137137974), Download

**Bricklin on Technology** Dan Bricklin, 2009-04-15 In a world that divides us, technology creates connection. Cell phones, e-mail, digital cameras, personal Web sites—they all join us, however tenuously, to what we value. Is connectivity what we're willing to pay for? Should technology be our servant or a tool that helps us do other things? What can we really learn from Napster? What would intelligent standards for touch-screen user interface

look like? How does technology evolve, and what drives that evolution? For Dan Bricklin, technology cannot exist independently of the lives and needs of those who use it. For more than a decade he has shared his thoughts on this essential interdependence in blogs, podcasts, and essays. This volume compiles those observations, putting together case histories and new reflections for a fascinating study of how people and technology affect one another. Whether you're a software developer or a student of human nature, you'll find yourself drawn into this most intriguing discourse—because you are its subject.

*Micro System Technologies 90* Herbert Reichl, 2012-12-06 On September 10-13, 1990, the first international meeting on Microsystem Technologies takes place at the Berlin International Congress Center. Most of the traditional congresses deal with themes that become more and more specific, and only a small part of the scientific world is reflected. The Micro System Technologies is attempting to take the opposite direction: During the last two decades the development of microelectronics was characterized by a tremendous increase of complexity of integrated circuits. At the same time the fields of microoptics and micromechanics have been developed to an advanced state of the art by the application of thin film and semiconductor technologies. The trend of the future development is

to increase the integration density by combining the microelectronic, microoptic, and micro mechanic aspects to new complex multifunctional systems, which are able to comprise sensors, actuators, analogue and digital circuits on the same chip or on multichip-modules. Microsystems will lead to extensions of the field of microelectronic applications with important technical alterations and can open new considerable markets. For the realization of economical solutions for microsystems a lot of interdisciplinary cooperation and know-how has to be developed. New materials for sensitive layers, substrates, conducting, semiconducting, or isolating thin films are the basis for the development of new technologies. The increasing complexity leads to increasing interaction among electrical and non-electrical quantities.
