Women and Video Game Modding Bridget Whelan,Matthew Wilhelm Kapell,2020-01-17 The world of video games has long revolved around a subset of its player base: straight, white males aged 18-25. Highly gendered marketing in the late 1990s and early 2000s widened the gap between this perceived base and the actual diverse group who buy video games. Despite reports from the Entertainment Software Association that nearly half of gamers identify as female, many developers continue to produce content reflecting this imaginary audience. Many female gamers are in turn modifying the games. Modders alter the appearance of characters, rewrite scenes and epilogues, enhance or add love scenes and create fairy tale happy endings. This is a collection of new essays on the phenomenon of women and modding, focusing on such titles as Skyrim, Dragon Age, Mass Effect and The Sims. Topics include the relationship between modders and developers, the history of modding, and the relationship between modding and disability, race, sexuality and gender identity.

Dynamical Modeling of Biological Systems Stilianos Louca,2023-06-07 This book introduces concepts and practical tools for dynamical mathematical modeling of biological systems. Dynamical models describe the behavior of a system over time as a result of internal feedback loops and external forcing, based on mathematically formulated dynamical laws, similarly to how Newton's laws describe the movement of celestial bodies. Dynamical models are increasingly popular in biology, as they tend to be more powerful than static regression models. This book is meant for undergraduate and graduate students in physics, applied mathematics and data science with an interest in biology, as well as students in biology with a strong interest in mathematical methods. The book covers deterministic models (for example differential equations), stochastic models (for example Markov chains and autoregressive models) and model-independent aspects of time series analysis. Plenty of examples and exercises are included, often taken or inspired from the scientific literature, and covering a broad range of topics such as neuroscience, cell biology, genetics, evolution, ecology, microbiology, physiology, epidemiology and conservation. The book delivers generic modeling techniques used across a wide range of situations in biology, and hence readers from other scientific disciplines will find that much of the material is also applicable in their own field. Proofs of most mathematical statements are included for the interested reader, but are not essential for a practical understanding of the material. The book introduces the popular scientific programming language MATLAB as a tool for simulating models, fitting models to data, and visualizing data and model predictions. The material taught is current as of MATLAB version 2022b. The material is taught in a sufficiently general way that also permits the use of alternative programming languages.

Property and Sovereignty James Charles Smith,2016-04-15 This book explores the relationships between property and the concept of sovereignty from a number of different perspectives. It distinguishes between the dual meaning of 'sovereignty' in property discourse - political sovereignty and owner sovereignty. The contributors discuss the nature of sovereignty in both senses, applying it to a wide range of topics such as the evolution of property rights in fragile and conflict-affected nation states, and notions of sovereign property in new worlds. A section on the Arts illuminates the relationships between property, sovereignty, and culture, and a further section investigates regulatory property and governmental control over resources. The book concludes with an exploration of sovereign shaping of private property entitlements to achieve instrumental ends. This interesting collection will be valuable to those in the fields of legal philosophy, property theory, international and comparative law, and political sociology. Essentials of Landscape Ecology Kimberly A. With,2019-07 Human activity during the Anthropocene has transformed landscapes worldwide on a scale that rivals or exceeds even the largest of natural forces. Landscape ecology has emerged as a science to investigate the interactions between natural and anthropogenic landscapes and ecological processes across a wide range of scales and systems: from the effects of habitat or resource distributions on the individual movements, gene flow, and population dynamics of plants and animals; to the human alteration of landscapes affecting the structure of biological communities and the functioning of entire ecosystems; to the sustainable management of natural resources and the ecosystem goods and services upon which society depends. This novel and comprehensive text presents the principles, theory, methods, and applications of landscape ecology in an engaging and accessible format that is supplemented by numerous examples and case studies from a variety of systems, including freshwater and marine scapes.
