Systems Biology of Transcription Regulation Ekaterina Shelest, Edgar Wingender, Joerg Linde, 2016-09-09 Transcription regulation is a complex process that can be considered and investigated from different perspectives. Traditionally and due to technical reasons (including the evolution of our understanding of the underlying processes) the main focus of the research was made on the regulation of expression through transcription factors (TFs), the proteins directly binding to DNA. On the other hand, intensive research is going on in the field of chromatin structure, remodeling and its involvement in the regulation. Whatever direction we select, we can speak about several levels of regulation. For instance, concentrating on TFs, we should consider multiple regulatory layers, starting with signaling pathways and ending up with the TF binding sites in the promoters and other regulatory regions. However, it is obvious that the TF regulation, also including the upstream processes, represents a modest portion of all processes leading to gene expression. For more comprehensive description of the gene regulation, we need a systematic and holistic view, which brings us to the importance of systems biology approaches. Advances in methodology, especially in high-throughput methods, result in an ever-growing mass of data, which in many cases is still waiting for appropriate consideration. Moreover, the accumulation of data is going faster than the development of algorithms for their systematic evaluation. Data and methods integration is indispensable for the acquiring a systematic as well as a systemic view. In addition to the huge amount of molecular or genetic components of a biological system, the even larger number of their interactions constitutes the enormous complexity of processes occurring in a living cell (organ, organism). In systems biology, these interactions are represented by networks. Transcriptional or, more generally, gene regulatory networks are being generated from experimental ChIPseq data, by reverse engineering from transcriptomics data, or from computational predictions of transcription factor (TF) – target gene relations. While transcriptional networks are now available for many biological systems, mathematical models to simulate their dynamic behavior have been successfully developed for metabolic and, to some extent, for signaling networks, but relatively rarely for gene regulatory networks. Systems biology approaches provide new perspectives that raise new questions. Some of them address methodological problems, others arise from the newly obtained understanding of the data. These open questions and problems are also a subject of this Research Topic.

Foundations of an African Civilisation David W. Phillipson, 2014 Focuses on the Aksumite state of the first millennium AD in northern Ethiopia and southern Eritrea, its development, florescence and eventual transformation into the so-called medieval civilisation of Christian Ethiopia. This book seeks to apply a common methodology, utilising archaeology, art-history, written documents and oral tradition from a wide variety of sources; the result is a far greater emphasis on continuity than previous studies have revealed. It is thus a major re-interpretation of a key development in Ethiopia's past, while raising and discussing methodological issues of the relationship between archaeology and other historical disciplines; these issues, which have theoretical significance extending far beyond Ethiopia, are discussed in full. The last millennium BC is seen as a time when northern Ethiopia and parts of Eritrea were inhabited by farming peoples whose ancestry may be traced far back into the local 'Late Stone Age'. Colonisation from southern Arabia, to which defining importance has been attached by earlier researchers, is now seen to have been brief in duration and small in scale, its effects largely restricted to élite sections of the community. Re-consideration of inscriptions shows the need to abandon the established belief in a single 'Pre-Aksumite' state. New evidence for the rise of Aksum during the last centuries BC is critically evaluated. Finally, new chronological precision is provided for the decline of Aksum and the transfer of centralised political authority to more southerly regions. A new study of the ancient churches - both built and rock-hewn - which survive from this poorly-understood period emphasises once again a strong degree of continuity across periods that were previously regarded as distinct.--Publisher's website.

Handbook of Immune Response Genes Tak W. Mak, John J. L. Simard, 2007-07-27 The study of immunology encompasses a vast and ever-growing body of information that in some way or other incorporates most areas of medical biological research. As the body of information in the medical sciences continues to increase its rate of expansion, one of the greatest challenges to investigators will be to integrate this information in a manner that is intellectually fruitful and productive. Considering the intended scope of this text, we could not pretend to have gone too far toward achieving such an integration--and considering the pace of change, in its very best form a measured approximation of such lofty goals might be the most we could hope for. Nevertheless, in these pages we have sought to produce a collection of information that is at once concise and up-to-date regarding areas where important developments are impacting on the way we understand the vertebrate immune system. In addition, although the information is geared toward advanced study, we have discussed some basic elements and concepts that we hope make the text a useful resource for both the immunologist and the nonspecialist. The intention is to provide the researcher, clinician, or advanced undergraduate student with a brief overview of specific components of the immune system, and to provide a place from which to begin further detailed study if necessary. To this end, we made every effort to supply extensive referencing--although limitations in space prevented exhaustive or complete referencing in some cases.

In the decade since the publication of the last edition, the study of reproductive physiology has undergone monumental changes. Chief among these advances are in the areas of stem cell development, signaling pathways, the role of inflammation in the regulatory processes in the various tissues, and the integration of new animal models which have led to a greater understanding of human disease. The new edition synthesizes all of this new information at the molecular, cellular, and organismal levels of organization and present modern physiology a more understandable and comparative context. The Fourth Edition has been extensively revised, reflecting new fundamental advancements in this rapidly advancing field. Provides a common language for researchers across the fields of physiology, endocrinology, and biology to discuss their understanding of reproduction. Saves academic researchers time in quickly accessing the very latest details on reproductive physiology, as opposed to searching through thousands of journal articles.
