Making Sense of Space Iryna Kuksa, Mark

Childs, 2014-06-16 The use of Virtual Worlds (VWs) has increased in the last decade. VWs are used for communication, education, community building, creative arts, and more. A good deal of research has been conducted into learning and VWs, but other areas remain ripe for investigation. Factors from technological platforms to the nature and conventions of the communities that use VWs must be considered, in order to achieve the best possible interaction between virtual spaces and their users. Making Sense of Space focuses on the background to these issues, describing a range of case studies conducted by the authors. The book investigates the innovative and creative ways designers employ VWs for research, performance-making, and audience engagement. Secondly, it looks into how educators use these spaces to support their teaching practice. Lastly, the book examines the potential of VWs as new methods of communication, and the ways they are changing our perception of reality. This book is structured into four chapters. An introduction provides a history and outline of important themes for VWs, and subsequent chapters consider the design of virtual spaces, experience of virtual spaces, and communication in virtual spaces. Written by two experienced academics and practitioners in the field, offering different perspectives Uses a multidisciplinary approach, drawing on: education; scenography; performance studies; disaster management; and computer science Provides multiple viewpoints on the topic, gained through interviews

and contributions from a range of experts, as well as several co-authored chapters

Progress in Thermochemical Biomass Conversion A. V. Bridgwater, 2008-04-30 This book is for chemical engineers, fuel technologists, agricultural engineers and chemists in the world-wide energy industry and in academic, research and government institutions. It provides a thorough review of, and entry to, the primary and review literature surrounding the subject. The authors are internationally recognised experts in their field and combine to provide both commercial relevance and academic rigour. Contributions are based on papers delivered to the Fifth International Conference sponsored by the IEA Bioenergy Agreement.

Brazing Dieter Miedek, Brazing is the ideal joining method for many tasks in model making, but also, for example, in the restoration of original vehicles. For some model building projects such as steam engines and boilers, this technique is even indispensable. But also, in ship and truck modelling or, for example, for special applications in aircraft modelling, brazing can be used to produce stable and durable joints. The author has gained experience with brazing in his profession and hobby for decades and passes it on in this book. The physical and chemical basics as

well as materials and tools are explained in the same way as the extremely important safety aspects in this field. And, of course, the practical aspects of brazing are not neglected and are presented in all their diversity. With this book, brazing loses its reputation of being difficult and becomes a perfect addition to the working techniques of the model maker. From the content: • Physical properties of gases • Safety in flame brazing and welding • Technical gases • Handling gas cylinders • The equipment • Flame brazing - tips for the practitioner • Auxiliaries - the little helpers • The soldering process - theory is not the same as practice • The right soldering material • The soldering process • Small burners, lighter gas burners and gas cartridges • Compact equipment - mobile systems • The right equipment for different working practices

Annotation There have been impressive achievements in the last few years in the technologies associated with turboramjets and other combined cycle engines. These technologies, including their thermal management and integration with the vehicle, are the principal concerns of this volume. Drawing on the expertise of international engineers and researchers in the field of high-speed vehicle propulsion systems, these articles, written by experts from the United States, Russia, Germany, Japan, Belgium, and Israel, highlight developments in the industry.

Approaches for Clean Combustion in Gas Turbines
Medhat A. Nemitallah, Ahmed A. Abdelhafez, Mohamed A. Habib, 2020-03-24 This book focuses on the development of novel combustion approaches and burner designs for clean power generation in gas turbines. It shows the reader how to control the release of pollutants to the environment in an effort to reduce global warming. After an introduction to global warming issues and clean power production for gas turbine applications, subsequent chapters address premixed combustion, burner designs for clean power generation, gas turbine performance, and insights on gas turbine operability. Given its scope, the book can be used

as a textbook for graduate-level courses on clean combustion, or as a reference book to accompany compact courses for mechanical engineers and young researchers around the world.
