Ho, Amanda Ho, 2017-03-11 We have been very interested in creating a perfect workbook which could cover students' day schools' math curriculums in any countries for elementary students and also it must be fun for students to use; ideally it also should offer challenging problems for very intelligent students. This ideal workbook should cover a variety of topics such that it can be used for average students to gifted students. In the past, such a workbook must be created by using a few workbooks: one for school math, one for word problems, and one for puzzles etc.; the problem of using multiple workbooks is it is difficult for a teacher to teach by using three or four workbooks in once a week session of after-school learning centre. Through many years of research and teaching, Ho Math Chess has finally had a breakthrough. We have created a workbook Problem Solving and Math IQ Puzzles for different levels of students. To meet the requirement that this workbook can be used to teach day school math curriculums for different countries, our workbook contents levels are very high and at the same time, this type of workbook also adds fun into math learning by incorporating puzzles. We also included many of our own intellectual and copyrighted puzzles in the workbook. For students who are interested in preparing math contests, we have produced a math contest preparation workbook. For students who are interested in learning chess, we also have produced a chess learning workbook. We also have a Frankho ChessDoku specifically designed to train students in a combination of math computation, chess, and Sudoku. FrankhoMaze is a special type of maze which offers the feeling of 3-D maze play using chess moves. For those students who like to review math materials for test purposes, we have a review workbook produced just for that purpose. For the private schools' SSAT entrance exams, we produced SSAT preparation workbook.

Despite the publication of hundreds of textbooks in this field, each one intended to provide an improvement over previous textbooks, students of finite and discrete math continue to remain perplexed as a result of numerous subject areas that must be remembered and correlated when solving problems. Various interpretations of finite and discrete math terms also contribute to the difficulties of mastering the subject. In a study of finite and discrete math, REA found the following basic reasons underlying the inherent difficulties of finite and discrete math: No systematic rules of analysis were ever developed to follow in a step-by-step manner to solve typically

encountered problems. This results from numerous different conditions and principles involved in a problem that leads to many possible different solution methods. To prescribe a set of rules for each of the possible variations would involve an enormous number of additional steps, making this task more burdensome than solving the problem directly due to the expectation of much trial and error. Current textbooks normally explain a given principle in a few pages written by a finite and discrete math professional who has insight into the subject matter not shared by others. These explanations are often written in an abstract manner that causes confusion as to the principle's use and application. Explanations then are often not sufficiently detailed or extensive enough to make the reader aware of the wide range of applications and different aspects of the principle being studied. The numerous possible variations of principles and their applications are usually not discussed, and it is left to the reader to discover this while doing exercises. Accordingly, the average student is expected to rediscover that which has long been established and practiced, but not always published or adequately explained. The examples typically following the explanation of a topic are too few in number and too simple to enable the student to obtain a thorough grasp of the involved principles. The explanations do not provide sufficient basis to solve problems that may be assigned for homework or given on examinations. Poorly solved examples such as these can be presented in abbreviated form which leaves out much explanatory material between steps, and as a result requires the reader to figure out the missing information. This leaves the reader with an impression that the problems and even the subject are hard to learn - completely the opposite of what an example is supposed to do. Poor examples are often worded in a confusing or obscure way. They might not state the nature of the problem or they present a solution, which appears to have no direct relation to the problem. These problems usually offer an overly general discussion - never revealing how or what is to be solved. Many examples do not include accompanying diagrams or graphs, denying the reader the exposure necessary for drawing good diagrams and graphs. Such practice only strengthens understanding by simplifying and organizing finite and discrete math processes. Students can learn the subject only by doing the exercises themselves and reviewing them in class, obtaining experience in applying the principles with their different ramifications. In doing the exercises by themselves, students find that they are required to devote considerable more time to finite and discrete math than to other subjects, because they are uncertain with regard to the selection and application of the theorems and principles involved. It is also often necessary for students to discover those tricks not revealed in their texts (or review books) that make it possible to solve problems easily. Students must usually resort to methods of trial and error to discover these tricks, therefore finding out that they may sometimes spend several hours to solve a single problem. When reviewing the exercises in classrooms, instructors usually request students to take turns in writing solutions on the boards and explaining them to the class. Students often find it difficult to explain in a manner that holds the interest of the class, and enables the remaining students to follow the material written on the boards. The remaining students in the class are thus too occupied with copying the material off the boards to follow the professor's explanations. This book is intended to aid students in finite and discrete math overcome the difficulties described by supplying detailed illustrations of the solution methods that are usually not apparent to students. Solution methods are illustrated by problems that have been selected from those most often assigned for class work and given on examinations. The problems are arranged in order of complexity to enable students to learn and understand a particular topic by reviewing the problems in sequence. The problems are illustrated with detailed, step-by-step explanations, to save the students large amounts of time that is often needed to fill in the gaps that are usually found between steps of illustrations in textbooks or review/outline books. The staff of REA considers finite and discrete math a subject that is best learned by allowing students to view the methods of analysis and solution techniques. This learning approach is similar to that practiced in various scientific laboratories, particularly in the medical fields. In using this book, students may review and study the illustrated problems at their own pace; students are not limited to the time such problems receive in the classroom. When students want to look up a particular type of problem and solution, they can readily locate it in the book by referring

to the index that has been extensively prepared. It is also possible to locate a particular type of problem by glancing at just the material within the boxed portions. Each problem is numbered and surrounded by a heavy black border for speedy identification.

Ultimate Math Contest Preparation, Problem Solving Strategies, Math IQ Puzzles Frank Ho, Amanda Ho, 2016-12-13 This is an answers book for the student workbook Ultimate Math Contest Preparation, Problem Solving Strategies, Math IQ Puzzles for Grades 2 and 3. It has been almost 20 years since I published the first math contest workbook in 2002 This workbook is 3-in-1, one-of-a-kind and world's first, I believe. In the past 20 years, I created many workbooks and the reason simply is because I could not find suitable teaching materials to use at my own after-school learning centre. Why I created another workbook this time? It is simply because there is a need for it. Let me explain. I created the following workbooks in the past: 1. Basics 2. Math IQ puzzles 3. Math and Chess Integrated workbooks using my invention of Geometry Chess Symbols 4. Math IQ Fitness 5. Integrated math, chess, and puzzles for the Creative minds 6. Math Contest The trouble is, with every class, we have diversified students with different levels of math ability. Some of them could participate in discussion. some of them were always quiet. They basically do not get full benefits by the discussion style of teaching. So, I discovered the method of student collaboration and the teach coaching method only makes sense when students are at the same level of play field, otherwise, the star will always be a star and others tend to fade away with no ideas to discuss at all. How to handle this condition of teaching? I need a good arsenal of workbooks. For those who can do math contest quality problems, I give them Math Contest books; for those who need to boost their brain thinking skills, I give them Math IQ Fitness; for those who do not like play competitive chess, I give them chess and math puzzles; for those who are falling behind, I give them Basics workbooks. The result is many students end up with 4 to 6 workbooks on their desks. The assignment marking also is a night mare. With 2-hours math teaching, I need a variety of teaching materials, much like the entertainment variety show. It would be boring if the singer continuously sing for 2-hours. The same reason for teaching math to elementary students, they need varieties of teaching contents, so I decided to combine some of my workbooks into one that is why this combined workbook is so huge, larger than most of the math workbooks you would find on the market. This workbook is designed to teach in a very small class size preferably 4 or 5 students so that students could get lots of opportunities to discuss with the teacher. One-on-one teaching would be ideal because the student get 100% attention constantly. This workbook can be used in enrichment class because it includes many contest quality problems and thus could also be used for preparing math contests. It includes many mathematical puzzles so it could be used as a fun math teaching workbook. It also includes many mixed computations and advanced word problems, so it could be used for chess clubs while teaching chess lessons. The use of this workbook is multi-faceted. <https://www.scribd.com/document/334185794/Sample-of-20-Pages-of-Ultimate-Math-Contest-Grade-2>

Ultimate Math Contest Preparation, Problem Solving Strategies, and Math IQ Puzzles Grade 6 and 7 Amanda Ho, Frank Ho, 2019-04-28 I wrote this workbook with a vision that is I wanted to create a workbook which, I think, will be good and useful for children. This workbook was created based on my personal educational background and teaching experience and my own chess coaching experience with my own son. All these experiences and observations tell me that a student has a higher IQ and has higher than average math score does not mean necessarily that this student will do well in math contests. Everybody can learn math, but the results could be very different. Other than to have a smart brain and the ability to learn math faster than the other children, a child needs other qualities' to do well consistently in math contests. These special qualities include perseverance, patience, and willingness to take the time to think. The ability to be able to draw a conclusion; do comparisons; expand and instil learned knowledge onto other problems; can follow and write procedures or steps neatly and logically; organize and list data; visualize spatial relations. The student could be trained vigorously but without real interest and willingness to work on problems, then the enthusiasm of training on math contests will last long, so we know to use one pure math contest workbook alone is difficult to achieve the effect of all-around training. The is my

vision of creating this integrated 3-in-1, unique workbook. Why is this workbook so huge? (What unique is about this workbook?) How to train a child to be more patient? How to train a student to observe and compare? One way of achieving these is to use puzzles, this is the main reason that puzzles are included in this book. Further, puzzles can increase a child's IQ. How to train a child to think out of the box and be creative? The integrated chess, Sudoku, and math computational puzzles can help. When considering all the above purposes, the result is that this workbook has become a huge workbook. How did I get started to create this workbook? I received my university education in Taiwan and later received my Science of Statistics master's degree in the US. My working of teaching and research of math at my own learning Centre Ho Math Chess based in Canada has offered me insights on how math is taught differently in different countries. The integrated game is a good way of learning math, in our case, chess is integrated into our worksheets, not a totally separate subject. This is one uniqueness of our series of Ultimate Math Contest Preparation, Problem Solving Strategies, and Math IQ Puzzles workbook. Since each of our workbooks has many different parts, so students could pick other materials other than math contest. Why teachers, coaches, parents, or students should buy this workbook? We need a workbook which not only just teaches math contest, it should also be fun for children to work on and at the same time to enhance their brain power. This is the vision which leads me to create this workbook and if you agree with my idea and view, then this world's first 3-in-1 integrated math contest, problem-solving strategies and fun math IQ workbook is for you and your student or child.

Math Is Not Magic Jerry Knoelke, 2017-10-13 Everyone needs a better way to understand Math. Math Is Not Magic focuses on what the other books are missing. Math Is Not Magic provides the universal conceptual process that helps you understand how to solve word problems covering Algebra 1 & 2, Geometry, Trigonometry, Calculus, Probability, and Statistics. Math Is Not Magic shows you what to do to solve a word problem and explains how to picture getting to the solution. Everyone needs to understand that the mind thinks in pictures and not in words. Teaching people to picture how to solve a word problem will not only get them the answer but also help them envision how they got it.

Mathematical Cultures Brendan Larvor, 2016-05-25 This collection presents significant contributions from an international network project on mathematical cultures, including essays from leading scholars in the history and philosophy of mathematics and mathematics education. Mathematics has universal standards of validity. Nevertheless, there are local styles in mathematical research and teaching, and great variation in the place of mathematics in the larger cultures that mathematical practitioners belong to. The reflections on mathematical cultures collected in this book are of interest to mathematicians, philosophers, historians, sociologists, cognitive scientists and mathematics educators.

Computational Complexity of Solving Equation Systems Przemysław Broniek, 2015-07-24 This volume considers the computational complexity of determining whether a system of equations over a fixed algebra A has a solution. It examines in detail the two problems this leads to: $\text{SysTermSat}(A)$ and $\text{SysPolSat}(A)$, in which equations are built out of terms or polynomials, respectively. The book characterizes those algebras for which SysPolSat can be solved in a polynomial time. So far, studies and their outcomes have not covered algebras that generate a variety admitting type 1 in the sense of Tame Congruence Theory. Since unary algebras admit only type 1, this book focuses on these algebras to tackle the main problem. It discusses several aspects of unary algebras and proves that the Constraint Satisfaction Problem for relational structures is polynomially equivalent to SysTermSat over unary algebras. The book's final chapters discuss partial characterizations, present conclusions, and describe the problems that are still open.

Ultimate Math Contest Preparation, Problem Solving Strategies, Math IQ Puzzles Frank Ho, Amanda Ho, 2016-11-17 This workbook is aimed at math contests preparation for grades 1 and 2 and has a separate answer book. All contents are in English except some headings for the purpose of selling in China. Only the knowledge of basic chess moves is needed in solving some of the problems. The chess moves can be easily learned in a few minutes with my inventions of Geometry Chess Symbols which show what you see is what you move. There are not many math contests for grades 1 and 2. The main reason, I think, is the limited math computation ability of lower grades students. Many North American students will not learn multiplication until grade 3, but many Asian countries and areas learn times table at grade 2, so there is one year of difference of learning ahead in China. This workbook has brought its standard to meet the highest possible math curriculum in the world so four operations of computation appear in this workbook. The earlier the students could master the skills of four basic operations, the more the students could explore many possibilities of word problem computation problems. With this in mind, how does the very popular Math Kangaroo Contest test the grade 1 and grade 2 students? How is it different from other math contests? The Math Kangaroo grades 1 and 2 Contest almost does not include the direct math computation problems which are very different from the math contests in China where direct computation problems could include skillful computation problems. I analyzed the most recent years of Canadian Math Kangaroo Contest grade 1 and 2 problems and they start to emerge some characteristics and categories, so I include here to help students prepare for it. The lower grade math contest tends to skew to the more visual operation type of problems. The problems could be classified as follows: Arrangement and sorting numbers Patterns of figures and numbers Counting figures or shapes or paths Cubes or cards math including rotation or folding Identifying parts of a figure or finding what part of a figure is missing Number puzzles including filling numbers into empty spaces Logic and reasoning problems Word problems Including some Chinese model problems All other problems which do not belong to the above. Many of the above problems are not typical problems appeared in the books where you can buy from a bookstore because the problems in the math contests are much more complicated and involve a lot of creativities. The above subjects are now included in this workbook. Our math contest books are suitable for preparing the following math contests or competitions. Worldwide Math Kangaroo Contests USA Mathcounts USA Math Olympiad Mathleague Math Contest Canada BC Elmacon Math Contest Canadian Math Challengers Competition Canadian Gauss & Pascal Mathematics Mathematica Pythagoras, Euler, Langrange, Newton contests Worldwide Caribou Mathematics Online Contest (USA Brock University) Chinese math contests Many countries' math competitions Worldwide Math Kangaroo Contests

Tassell,2018-09-03 This volume provides new insights on creativity while focusing on innovative methodological approaches in research and practice of integrating technological tools and environments in mathematics teaching and learning. This work is being built on the discussions at the mini-symposium on Creativity and Technology at the International Conference on Mathematical Creativity and Giftedness (ICMCG) in Denver, USA (2014), and other contributions to the topic. The book emphasizes a diversity of views, a variety of contexts, angles and cultures of thought, as well as mathematical and educational practices. The authors of each chapter explore the potential of technology to foster creative and divergent mathematical thinking, problem solving and problem posing, creative use of dynamic, multimodal and interactive software by teachers and learners, as well as other digital media and tools while widening and enriching transdisciplinary and interdisciplinary connections in mathematics classroom. Along with ground-breaking innovative approaches, the book aims to provide researchers and practitioners with new paths for diversification of opportunities for all students to become more creative and innovative mathematics learners. A framework for dynamic learning conditions of leveraging mathematical creativity with technology is an outcome of the book as well.
