Cable Shielding for Electromagnetic Compatibility Anatoly Tsaliovich,2012-12-06 The mathematical theory of wave propagation along a conductor with an external coaxial return is very old, going back to the work of Rayleigh, Heaviside, and J. J. Thomson. These words were written by S. A. Schelkunoff back in 1934. Indeed, those early works dealt with signal propagation along the line as well as electromagnetic shielding of the environment inside and/or outside the metallic enclosures. Maxwell himself developed pioneering studies of single-layer shielding shells, while a paper with such a modern title as On the Magnetic Shielding of Concentric Spherical Shells was presented by A. W. Rucker as early as 1893! * Such state of the art shielding theory created in the last century is even more amazing if you think that at almost the same time (namely, in 1860s), a manuscript of Jules Verne's book, Paris in the 20th Century, was rejected by a publisher because it predicted such outrageously incredible electrotechnology as, for example, FAX service by wires and the electrocutioner's chair. (With regard to the last invention, I suspect many readers would rather Jules Verne has been wrong.) However, although the beginning of electromagnetic shielding theory and its implementation to electronic cables date back more than a century, this dynamic field keeps constantly growing, driven by practical applications.

Index Theory, Coarse Geometry, and Topology of Manifolds Paul C. Shields,1996 This is an interesting and well-written account of the ergodic theory of stationary processes from the viewpoint of entropy theory. This book is a beautiful and very readable treatment of an important part of ergodic theory. ... strongly recommend this book to anyone who is interested in ergodic theory, stochastic processes or information theory. --Bulletin of the London Mathematical Society This book is about finite-alphabet stationary processes, which are important in physics, engineering, and data compression. The focus is on the combinatorial properties of typical finite sample paths drawn from a stationary, ergodic process. A primary goal, only partially realized, is to develop a theory based directly on sample path arguments with minimal appeals to the probability formalism. A secondary goal is to give a careful presentation of the many models for stationary finite-alphabet processes that have been developed in probability theory, ergodic theory, and information theory. The book has many attractive features for both students and researchers. An emphasis is placed on recent combinatorial results for sample paths. There are careful treatments of many models that have been found to be useful in engineering. Shields covers applications of entropy ideas to coding, sample path structure, distribution estimation, recurrence times, waiting times, and prefix trees.
