Pro ASP.NET Web API Security Badrinarayanan Lakshmiraghavan,2013-05-13 ASP.NET Web API is a key part of ASP.NET MVC 4 and the platform of choice for building RESTful services that can be accessed by a wide range of devices. Everything from JavaScript libraries to RIA plugins, RFID readers to smart phones can consume your services using platform-agnostic HTTP. With such wide accessibility, securing your code effectively needs to be a top priority. You will quickly find that the WCF security protocols you're familiar with from .NET are less suitable than they once were in this new environment, proving themselves cumbersome and limited in terms of the standards they can work with. Fortunately, ASP.NET Web API provides a simple, robust security solution of its own that fits neatly within the ASP.NET MVC programming model and secures your code without the need for SOAP, meaning that there is no limit to the range of devices that it can work with – if it can understand HTTP, then it can be secured by Web API. These SOAP-less security techniques are the focus of this book.

Penetration Testing of Computer Networks Using BurpSuite and Various Penetration Testing Tools Dr. Hidaia Mahmood Alassouli,2023-02-23 Burp Suite is an integrated platform/graphical tool for performing security testing of web applications. Burp suite is a java application that can be used to secure or crack web applications. The suite consists of different tools, like a proxy server, a web spider an intruder and a so-called repeater, with which requests can be automated. You can use Burp's automated and manual tools to obtain detailed information about your target applications. Damn Vulnerable Web App (DVWA) is a PHP/MySQL web application that is damn vulnerable. Its main goals are to be an aid for security professionals to test their skills and tools in a legal environment, help web developers better understand the processes of securing web applications and aid teachers/students to teach/learn web application security in a class room environment. In this report I am using a combination of Burp tools to detect and exploit vulnerabilities in Damn Vulnerable Web App (DVWA) with low security. By default, Burp Scanner scans all requests and responses that pass through the proxy. Burp lists any issues that it identifies under Issue activity on the Dashboard. You can also use Burp Scanner to actively audit for vulnerabilities. Scanner sends additional requests and

analyzes the application's traffic and behavior to identify issues. Various examples are outlined in this report for different types of vulnerabilities such as: SQL injection, Cross Site Request Forgery (CSRF), Cross-site scripting, File upload, Local and Remote File Inclusion. I tested various types of penetration testing tools in order to exploit different types of vulnerabilities. The report consists from the following parts: 1. Installing and Configuring BurpSuite 2. BurpSuite Intruder. 3. Installing XMAPP and DVWA App in Windows System. 4. Installing PHP, MySQL, Apache2, Python and DVWA App in Kali Linux. 5. Scanning Kali-Linux and Windows Using . 6. Understanding Netcat, Reverse Shells and Bind Shells. 7. Adding Burps Certificate to Browser. 8. Setting up Target Scope in BurpSuite. 9. Scanning Using BurpSuite. 10. Scan results for SQL Injection Vulnerability with BurpSuite and Using SQLMAP to Exploit the SQL injection. 11. Scan Results for Operating System Command Injection Vulnerability with BurpSuite and Using Commix to Exploit the OS Command Injection. 12. Scan Results for Cross Side Scripting (XSS) Vulnerability with BurpSuite, Using Xserve to exploit XSS Injection and Stealing Web Login Session Cookies through the XSS Injection. 13. Exploiting File Upload Vulnerability. 14: Exploiting Cross Site Request Forgery (CSRF) Vulnerability. 15. Exploiting File Inclusion Vulnerability. 16. References.

   Secure Programming Cookbook for C and C++ John Viega,Matt Messier,2003-07-14 Password sniffing, spoofing, buffer overflows, and denial of service: these are only a few of the attacks on today's computer systems and networks. At the root of this epidemic is poorly written, poorly tested, and insecure code that puts everyone at risk. Clearly, today's developers need help figuring out how to write code that attackers won't be able to exploit. But writing such code is surprisingly difficult. Secure Programming Cookbook for C and C++ is an important new resource for developers serious about writing secure code. It contains a wealth of solutions to problems faced by those who care

about the security of their applications. It covers a wide range of topics, including safe initialization, access control, input validation, symmetric and public key cryptography, cryptographic hashes and MACs, authentication and key exchange, PKI, random numbers, and anti-tampering. The rich set of code samples provided in the book's more than 200 recipes will help programmers secure the C and C++ programs they write for both Unix® (including Linux®) and Windows® environments. Readers will learn: How to avoid common programming errors, such as buffer overflows, race conditions, and format string problems How to properly SSL-enable applications How to create secure channels for client-server communication without SSL How to integrate Public Key Infrastructure (PKI) into applications Best practices for using cryptography properly Techniques and strategies for properly validating input to programs How to launch programs securely How to use file access mechanisms properly Techniques for protecting applications from reverse engineering The book's web site supplements the book by providing a place to post new recipes, including those written in additional languages like Perl, Java, and Python. Monthly prizes will reward the best recipes submitted by readers. Secure Programming Cookbook for C and C++ is destined to become an essential part of any developer's library, a code companion developers will turn to again and again as they seek to protect their systems from attackers and reduce the risks they face in today's dangerous world.
