Management Education in the Network Economy Peter J. van Baalen,Lars T. Moratis,2012-12-06 In the network economy, concepts of management knowledge, management learning, and business school organization should change. Otherwise, they will not survive the 21st century. Different (f)actors are putting new demand upon providers of management education and traditional providers of management education are faced with new competitors. Moreover, the dynamics of the playing field have changed, as have approaches to (management) learning. Management Education in the Network Economy proposes the idea of networked business school to cope with these challenges. The book deals with the following subjects: 1) Current economic and organizational realities can best be viewed from the perspective of network organization; management knowledge and education should reflect these transformations to survive. 2) The idea and organization of (management) learning are revolutionizing, as well as the market for (management) education, which brings about huge changes for business schools. 3) Business school, particularly, should capitalize on these transformations and should strategically (re)organize and (re)position

themselves to compete in the playing field for management education. 4) A networked learning environment is an integrative and effective learning environment for organizing management education in the 21st century network economy. 5) The networked business school is the organizational form to survive in the 21st century network economy, reflecting the environmental changes and demands, and to realize a competitive edge in the field of management education.

Kubernetes Management Design Patterns Deepak Vohra,2017-01-20 Take container cluster management to the next level; learn how to administer and configure Kubernetes on CoreOS; and apply suitable management design patterns such as Configmaps, Autoscaling, elastic resource usage, and high availability. Some of the other features discussed are logging, scheduling, rolling updates, volumes, service types, and multiple cloud provider zones. The atomic unit of modular container service in Kubernetes is a Pod, which is a group of containers with a common filesystem and networking. The Kubernetes Pod abstraction enables design patterns for containerized applications similar to object-oriented design patterns. Containers provide some of the same benefits as software objects such as modularity or packaging, abstraction, and reuse. CoreOS Linux is used in the majority of the chapters and other platforms discussed are CentOS with OpenShift, Debian 8 (jessie) on AWS, and Debian 7 for Google Container Engine. CoreOS is the main focus becayse Docker is pre-installed on CoreOS out-of-the-box. CoreOS: Supports most cloud providers (including Amazon AWS EC2 and Google Cloud Platform) and virtualization platforms (such as

VMWare and VirtualBox) Provides Cloud-Config for declaratively configuring for OS items such as network configuration (flannel), storage (etcd), and user accounts Provides a production-level infrastructure for containerized applications including automation, security, and scalability Leads the drive for container industry standards and founded appc Provides the most advanced container registry, Quay Docker was made available as open source in March 2013 and has become the most commonly used containerization platform. Kubernetes was open-sourced in June 2014 and has become the most widely used container cluster manager. The first stable version of CoreOS Linux was made available in July 2014 and since has become one of the most commonly used operating system for containers. What You'll Learn Use Kubernetes with Docker Create a Kubernetes cluster on CoreOS on AWS Apply cluster management design patterns Use multiple cloud provider zones Work with Kubernetes and tools like Ansible Discover the Kubernetes-based PaaS platform OpenShift Create a high availability website Build a high availability Kubernetes master cluster Use volumes, configmaps, services, autoscaling, and rolling updates Manage compute resources Configure logging and scheduling Who This Book Is For Linux admins, CoreOS admins, application developers, and container as a service (CAAS) developers. Some pre-requisite knowledge of Linux and Docker is required. Introductory knowledge of Kubernetes is required such as creating a cluster, creating a Pod, creating a service, and creating and scaling a replication controller. For introductory Docker and Kubernetes information, refer to Pro Docker (Apress) and Kubernetes Microservices with Docker (Apress). Some pre-requisite knowledge about using Amazon Web Services (AWS) EC2, CloudFormation, and VPC is also required.
