**Packrafting** Molly Absolon,2017-05-15 Don't Be Left Up a River... Without a PackraftPackrafts are lightweight, inflatable boats that can be carried in a backpack, on a bicycle or in a duffel bag. These compact, tough personal watercrafts are used to float rivers, run rapids, cross lakes, and even drop waterfalls, often as part of a broader wilderness expedition that includes backpacking. Packrafting is rapidly gaining in popularity, with increasingly varied options for gear, ranging by size, cost, and function. With the number of guided packrafting trips on the rise, this is the perfect book for the beginner interested in the up-and-coming sport.

**Virtual Airplane** Witold Jaworski,2015-03-15 This book will teach you how to create the model shown on its cover. It assumes that you may know nothing about the 3D modeling software, and starts this course from the very basics. In subsequent chapters the author gradually introduces new methods and tools, on the example of building a model of the P-40B fighter. Every step of this workflow is presented in numerous illustrations. The goal of this book is to encourage all the plastic modelers for this new branch of their hobby. To make this hobby more affordable, this course uses solely the free (Open Source) software. This publication may also be interesting to all who would like to master the powerful Blender 3D package. Virtual Airplane contains so many illustrations (over 2400) that it is readable to some extent even in a foreign language. If you want to skim all of its contents, search the Google Books for its free version (ISBN: 9788394141752, it is a Polish translation), or visit [airplanes3d.net](http://airplanes3d.net).

**Timber Bridges** Michael A. Ritter,Departm U. S. Department of Agriculture,Forest Service U. S. Forest Service,2005 Timber's strength, light weight, and energy-absorbing properties furnish features desirable for bridge construction. Timber is capable of supporting short-term overloads without adverse effects. Contrary to popular belief, large wood members provide good fire resistance qualities that meet or exceed those of other materials in severe fire exposures. From an economic standpoint, wood is competitive with other materials on a first-cost basis and shows advantages when life cycle costs are compared. Timber bridges can be constructed in virtually any weather conditions, without detriment to the material. Wood is not damaged by continuous freezing and thawing and resists harmful effects of de-icing agents, which cause deterioration in other bridge materials. Timber bridges do not require special equipment for installation and can normally be constructed without highly skilled labor. They also present a natural and aesthetically pleasing appearance, particularly in natural surroundings. The misconception that wood provides a short service life has plagued timber as a construction material. Although wood is susceptible to decay or insect attack under specific conditions, it is inherently a very durable material when protected from moisture. Many covered bridges built during the 19th century have lasted over 100 years because they were protected from direct exposure to the elements. In modern applications, it is seldom practical or economical to cover bridges; however, the use of wood preservatives has extended the life of wood used in exposed bridge applications. Using modern application techniques and preservative chemicals, wood can now be effectively protected from deterioration for periods of 50 years or longer. In addition, wood treated with preservatives requires little maintenance and no painting. Another misconception about wood as a bridge material is that its use is limited to minor structures of no appreciable size. This belief is probably based on the fact that trees for commercial timber are limited in size and are normally harvested before they reach maximum size. Although tree diameter limits the size of sawn lumber, the advent of glued-laminated timber (glulam) some 40 years ago provided designers with several compensating alternatives. Glulam, which is the most widely used modern timber bridge material, is manufactured by bonding sawn lumber laminations together with waterproof structural adhesives. Thus, glulam members are virtually unlimited in depth, width, and length and can be manufactured in a wide range of shapes. Glulam provides higher design strengths than sawn lumber and provides better utilization of the available timber resource by permitting the manufacture of large wood structural elements from smaller lumber sizes. Technological advances in laminating over the past four decades have further increased the suitability and performance of wood for modern highway bridge applications.

**Uranium Enrichment and Nuclear Weapon Proliferation** Allan S. Krass,Peter Boskma,Boelie Elzen,Wim A. Smit,Stockholm International Peace Research Institute,2020-11-20 Originally published in 1983, this book presents both the technical and political information necessary to evaluate the emerging threat to world security posed by recent advances in uranium enrichment technology. Uranium enrichment has played a relatively quiet but important role in the history of efforts by a number of nations to acquire nuclear weapons and by a number of others to prevent the proliferation of nuclear weapons. For many years the uranium enrichment industry was dominated by a single method, gaseous diffusion, which was technically complex, extremely capital-intensive, and highly inefficient in its use of energy. As long as this remained true, only the richest and most technically advanced nations could afford to pursue the enrichment route to weapon acquisition. But during the 1970s this situation changed dramatically. Several new and far more accessible enrichment techniques were developed, stimulated largely by the anticipation of a rapidly growing demand for enrichment services by the world-wide nuclear power industry. This proliferation of new techniques, coupled with the subsequent contraction of the commercial market for enriched uranium, has created a situation in which uranium enrichment technology might well become the most important contributor to further nuclear weapon proliferation. Some of the issues addressed in this book are: A technical analysis of the most important enrichment techniques in a form that is relevant to analysis of proliferation risks; A detailed projection of the world demand for uranium enrichment services; A summary and critique of present institutional non-proliferation arrangements in the world enrichment industry, and An identification of the states most likely to pursue the enrichment route to acquisition of nuclear weapons.
