Blueprints for Text Analytics Using Python Jens
Albrecht,Sidharth Ramachandran,Christian
Winkler,2020-12-04 Turning text into valuable
information is essential for businesses looking to
gain a competitive advantage. With recent
improvements in natural language processing (NLP),
users now have many options for solving complex
challenges. But it's not always clear which NLP
tools or libraries would work for a business's
needs, or which techniques you should use and in
what order. This practical book provides data
scientists and developers with blueprints for best
practice solutions to common tasks in text
analytics and natural language processing. Authors
Jens Albrecht, Sidharth Ramachandran, and
Christian Winkler provide real-world case studies
and detailed code examples in Python to help you
get started quickly. Extract data from APIs and
web pages Prepare textual data for statistical
analysis and machine learning Use machine learning
for classification, topic modeling, and
summarization Explain AI models and classification
results Explore and visualize semantic
similarities with word embeddings Identify
customer sentiment in product reviews Create a
knowledge graph based on named entities and their
relations
  C# Eric Butow,Tommy Ryan,2002 Each step in this
book is displayed with callouts to help you see
exactly where the action takes place on the
screen.
  Beyond HTML Richard Karpinski,1996 Here is the

Applied Text Analysis with Python Benjamin Bengfort,Rebecca Bilbro,Tony Ojeda,2018-06-11 From news and speeches to informal chatter on social media, natural language is one of the richest and most underutilized sources of data. Not only does it come in a constant stream, always changing and adapting in context; it also contains information that is not conveyed by traditional data sources. The key to unlocking natural language is through the creative application of text analytics. This practical book presents a data scientist's approach to building language-aware products with applied machine learning. You'll learn robust, repeatable, and scalable techniques for text analysis with Python, including contextual and linguistic feature engineering, vectorization, classification, topic modeling, entity resolution, graph analysis, and visual steering. By the end of the book, you'll be equipped with practical methods to solve any number of complex real-world problems. Preprocess and vectorize text into high-

dimensional feature representations Perform document classification and topic modeling Steer the model selection process with visual diagnostics Extract key phrases, named entities, and graph structures to reason about data in text Build a dialog framework to enable chatbots and language-driven interaction Use Spark to scale processing power and neural networks to scale model complexity

Machine Learning for Text Charu C. Aggarwal,2023-05-19 This second edition textbook covers a coherently organized framework for text analytics, which integrates material drawn from the intersecting topics of information retrieval, machine learning, and natural language processing. Particular importance is placed on deep learning methods. The chapters of this book span three broad categories:1. Basic algorithms: Chapters 1 through 7 discuss the classical algorithms for text analytics such as preprocessing, similarity computation, topic modeling, matrix factorization, clustering, classification, regression, and ensemble analysis. 2. Domain-sensitive learning and information retrieval: Chapters 8 and 9 discuss learning models in heterogeneous settings such as a combination of text with multimedia or Web links. The problem of information retrieval and Web search is also discussed in the context of its relationship with ranking and machine learning methods. 3. Natural language processing: Chapters 10 through 16 discuss various sequence-centric and natural language applications, such as feature engineering, neural language models, deep learning, transformers, pre-trained language models, text summarization, information extraction, knowledge graphs, question answering, opinion mining, text segmentation, and event detection. Compared to the first edition, this

second edition textbook (which targets mostly advanced level students majoring in computer science and math) has substantially more material on deep learning and natural language processing. Significant focus is placed on topics like transformers, pre-trained language models, knowledge graphs, and question answering.
