It also offers possible business models and a means to quantify them to complete the development process. This book is suitable for students on multi-disciplinary energy engineering courses, energy practitioners, ICT vendors aiming to develop new services to target the building industry, and decision makers aiming to structure an urban renovation program. Delivers a significant amount of exclusive knowledge on the topics of energy positive neighborhoods and smart energy districts Allows readers to grasp the complexity of this interdisciplinary topic by providing access to well-structured processes and tools Includes real life examples of the transformation of two demonstration sites that illustrate the concepts discussed to add context and value to their implementation

Net zero energy buildings Karsten Voss, Eike Musall, 2012-12-10 *Net zero energy buildings, equilibrium buildings or carbon neutral cities – depending on location and the reasons for making the calculation, the numbers are run differently. The variety of terms in use indicates that a scientific method is still lacking – which is a problem not just in regard to international communication, but also with respect to planning processes as a response to energy challenges. The clarification and meaning of the most important terms in use is extremely important for their implementation. Since October 2008, a panel of experts from an international energy agency has concerned itself with these topics as part of a project entitled “Towards Net Zero Energy Solar Buildings”. The objective is to analyse exemplary buildings that are near a zero-energy balance in order to develop methods and tools for the planning, design and operation of such buildings. The results are documented in this publication: In addition to the presentation of selected projects, it is not just architectural showcase projects that are shown – the focus is on relaying knowledge and experience gained by planners and builders. Even if many questions remain unanswered: Project examples that have already been implemented prove on a practical basis that the objective of a zero energy balance is already possible today.*

Solar Engineering of Thermal Processes, Photovoltaics and Wind John A. Duffie, William A. Beckman, Nathan Blair, 2020-03-24 *The bible of solar engineering that translates solar energy theory to practice, revised and updated The updated Fifth Edition of Solar Engineering of Thermal Processes, Photovoltaics and Wind contains the fundamentals of solar energy and explains how we get energy from the sun. The authors—noted experts on the topic—provide an introduction to the technologies that harvest, store, and deliver solar energy, such as photovoltaics, solar heaters, and cells. The book also explores the applications of solar technologies and shows how they are applied in various sectors of the marketplace. The revised Fifth Edition offers guidance for using two key engineering software applications, Engineering Equation Solver (EES) and System Advisor Model (SAM). These applications aid in solving complex equations quickly and help with performing long-term or annual simulations. The new edition includes*

all-new examples, performance data, and photos of current solar energy applications. In addition, the chapter on concentrating solar power is updated and expanded. The practice problems in the Appendix are also updated, and instructors have access to an updated print Solutions Manual. This important book:

- Covers all aspects of solar engineering from basic theory to the design of solar technology
- Offers in-depth guidance and demonstrations of Engineering Equation Solver (EES) and System Advisor Model (SAM) software
- Contains all-new examples, performance data, and photos of solar energy systems today
- Includes updated simulation problems and a solutions manual for instructors

Written for students and practicing professionals in power and energy industries as well as those in research and government labs, *Solar Engineering of Thermal Processes, Fifth Edition* continues to be the leading solar engineering text and reference.

Pandemic Societies Jean-Louis Denis, Catherine Régis, Daniel M. Weinstock, 2021-10-15 At the outset of the COVID-19 pandemic, many thought the changes taking place would be fleeting. It is now widely recognized that COVID-19 will not be the last pandemic in our highly interconnected world, and “pandemic societies” will be with us for some time. *Pandemic Societies* brings together experts in a wide range of academic disciplines to reflect on how their fields might be transformed in this new context. While the pandemic forces global institutions, such as the World Health Organization, to reimagine the ways in which they function, it also reaches into our everyday lives to change how we organize culture, performing arts, sports, tourism, and cities. Exploring how COVID-19 has altered people’s daily experiences – the ways they meet to play, to perform, and to entertain themselves – this book also pulls the lens back to take in the broader institutional and political contexts in which these quotidian activities are carried out. Examining the profound ways in which the COVID-19 pandemic has transformed every aspect of our lives, *Pandemic Societies* attempts to understand how we might act to steer this pandemic society, and how to reinvent institutions and practices that we think of as intrinsically face to face.

Complex Adaptive Systems Ted Carmichael, Andrew J. Collins, Mirsad Hadžikadić, 2019-06-14 This book emerged out of international conferences organized as part of the AAAI Fall Symposia series, and the Swarmfest 2017 conference. It brings together researchers from diverse fields studying these complex systems using CAS and agent-based modeling tools and techniques. In the past, the knowledge gained in each domain has largely remained exclusive to that domain. By bringing together scholars who study these phenomena, the book takes knowledge from one domain to provide insight into others. Most interesting phenomena in natural and social systems include constant transitions and oscillations among their various phases – wars, companies, societies, markets, and humans rarely stay in a stable, predictable state for long. Randomness, power laws, and human behavior ensure that the future is both unknown and challenging. How do events unfold? When do they take hold? Why do some initial events cause an avalanche while others do not? What characterizes these events? What are the thresholds that differentiate a sea change from a non-event? Complex adaptive systems (CAS) have proven to be a powerful tool for exploring these and other related phenomena. The authors characterize a general CAS model as having a large number of self-similar agents that: 1) utilize one or more levels of feedback; 2) exhibit emergent properties and self-organization; and 3) produce non-linear dynamic behavior. Advances in modeling and computing technology have led not only to a deeper understanding of complex systems in many areas, but they have also raised the possibility that similar fundamental principles may be at work across these systems, even though the underlying principles may manifest themselves differently.
