The Observer's Guide to Planetary Motion Dominic Ford,2014-05-14 To the naked eye, the most evident defining feature of the planets is their motion across the night sky. It was this motion that allowed ancient civilizations to single them out as different from fixed stars. “The Observer’s Guide to Planetary Motion” takes each planet and its moons (if it has them) in turn and describes how the geometry of the Solar System gives rise to its observed motions. Although the motions of the planets may be described as simple elliptical orbits around the Sun, we have to observe them from a particular vantage point: the Earth, which spins daily on its axis and circles around the Sun each year. The motions of the planets as observed relative to this spinning observatory take on more complicated patterns. Periodically, objects become prominent in the night sky for a few weeks or months, while at other times they pass too close to the Sun to be observed. “The Observer’s Guide to Planetary Motion” provides accurate tables of the best time for observing each planet, together with other notable events in their orbits, helping amateur astronomers plan when and what to observe. Uniquely each of the chapters includes extensive explanatory text, relating the events listed to the physical geometry of the Solar System. Along the way, many questions are answered: Why does Mars take over two years between apparitions (the times when it is visible from Earth) in the night sky, while Uranus and Neptune take almost exactly a year? Why do planets appear higher in the night sky when they’re visible in the winter months? Why do Saturn’s rings appear to open and close every 15 years? This book places seemingly disparate astronomical events into an understandable three-dimensional structure, enabling an appreciation that, for example, very good apparitions of Mars come around roughly every 15 years and that those in 2018 and 2035 will be nearly as good as that seen in 2003. Events are listed for the time period 2010-2030 and in the case of rarer events (such as eclipses and apparitions of Mars) even longer time periods are covered. A short closing chapter describes the seasonal appearance of deep sky objects, which follow an annual cycle as a result of Earth’s orbital motion around the Sun.

Neptune Ben Bova,2021-08-17 Hugo Award winner Ben Bova continues his grand tour of the human settled solar system with a fan-pleasing look at life in the Outer Planets, among the moons of Neptune. In the future, humanity has spread throughout the solar system, on planets and moons once

visited only by robots or explored at a distance by far-voyaging spacecraft. No matter how hostile or welcoming the environment, mankind has forged a path and found a home. In the far reaches of the solar system, the outer planets—billions of miles from Earth, unknown for millennia—are being settled. Neptune, the ice giant, is swathed in clouds of hydrogen, helium, and methane and circled by rings of rock and dust. Three years ago, Ilona Magyr's father, Miklos, disappeared while exploring the seas of Neptune. Everyone believes he is dead—crushed, frozen, or boiled alive in Neptune's turbulent seas. With legendary space explorer Derek Humbolt piloting her ship and planetary scientist Jan Meitner guiding the search, Ilona Magyr knows she will find her father—alive—on Neptune. Her plans are irrevocably altered when she and her team discover the wreckage of an alien ship deep in Neptune's ocean, a discovery which changes humanity's understanding of its future...and its past. The Universe Within Neil Shubin, 2013 **Kirkus Best Books of the Year (2013)** From one of our finest and most popular science writers, and the best-selling author of *Your Inner Fish*, comes the answer to a scientific mystery as big as the world itself: How are the events that formed our solar system billions of years ago embedded inside each of us? In *Your Inner Fish*, Neil Shubin delved into the amazing connections between human bodies--our hands, heads, and jaws--and the structures in fish and worms that lived hundreds of millions of years ago. In *The Universe Within*, with his trademark clarity and exuberance, Shubin takes an even more expansive approach to the question of why we look the way we do. Starting once again with fossils, he turns his gaze skyward, showing us how the entirety of the universe's fourteen-billion-year history can be seen in our bodies. As he moves from our very molecular composition (a result of stellar events at the origin of our solar system) through the workings of our eyes, Shubin makes clear how the evolution of the cosmos has profoundly marked our own bodies. The Secret Lives of Planets Paul Murdin, 2019-07-11 BBC Sky At Night Best Astronomy and Space Books of 2019 'A deft, frequently dramatic tour' Nature 'A highly readable distillation of humankind's knowledge of our solar system, gleaned over many centuries, with surprisingly many mysteries yet to be solved' Daily Mail 'The Secret Lives of Planets aims to be a user's guide to the Solar System, but it also turns out to be an inspiration to look at the Solar System as a long cosmic journey and find our place in it.' BBC Sky at Night 'A wonderfully clear and readable book . . . Gives a splendid overview of our Sun's planetary system, including its history and exploration' Dame Jocelyn Bell Burnell * We have the impression that the solar system is perfectly regular like a clock, or a planetarium instrument. On a short timescale it is. But, seen in a longer perspective, the planets, and their satellites, have exciting lives, full of events - for example, did you know that Saturn's moon, Titan, boasts lakes which contain liquid methane surrounded by soaring hills and valleys, exactly as the earth did before life evolved on our fragile planet? Or that Mercury is the shyest planet? Or, that Mars' biggest volcano is 100 times the size of Earth's, or that its biggest canyon is 10 times the depth of the Grand Canyon, or that it wasn't always red, but blue? The culmination of a lifetime of astronomy and wonder, Paul Murdin's enchanting new book reveals everything you ever wanted to know about the planets, their satellites, and our place in the solar system.

The Crystalline Planet S. B. Andresen, 2020-10-25 Sam and Christopher grew up together on the Earthen Moon Colony. Their fathers were best friends, so their sons were constant companions. Now grown up, Christopher is sent to a newly discovered planet on a secret mission, but communication from Christopher is long overdue. In an act of desperation, Sam now travels to find his best friend. Sam's mission is to find Christopher, recover all information about this new planet's Crystal Cavern, and return. The only evidence he has is a scan chip with a recorded message from Christopher that speaks of the enigmatic, spiritual inhabitants of seaside dwellings. In this recording, Christopher claims these people might be the key to finding the material he seeks. When Sam meets the people of this planet, he begins uncovering secrets the planet is hiding but also the secrets of his

own father. With Christopher having vanished without a trace, Sam must know what his best friend found. Is Christopher now safely part of this planetary tribe, or is there something much more devious—and political—at play?

Destiny Or Chance Revisited Stuart Ross Taylor, 2012-09-27 This exciting tour of our Universe explores our current knowledge of exoplanets and the search for another Earth-like planet. Beginning with the basic concepts of planet formation and the composition of the Universe, Stuart Ross Taylor summarises our knowledge of exoplanets, how they compare with our planets and why some stars have better habitable zones. Further sections provide a detailed study of our Solar System, as a basis for understanding exoplanetary systems, and a detailed study of the Earth as our only current example of a habitable planet. The book concludes with a philosophical and historical discussion of topics surrounding planets and the development of life, including why our chances of finding aliens on exoplanets is very low. This is an engaging and informative read for anyone interested in planetary formation and the exploration of our Universe.

So far we have no proof that life exists beyond our own planet, although, after a lot of work, scientists have surprisingly found places that could, in fact, sustain life. This, of course, isn't guaranteed, but, if we were to live there, we would do just fine. In the following list, I will be writing about the top 10 places that could quite possibly have alien life. Some of these places can be as far 1,000 light years or as close as Jupiter, keep reading to learn more about these extraordinary places.
