Patient-Specific Stem Cells Deepak A.

Lamba,2017-04-07 One of the biggest challenges faced in medical research had been to create accurate and relevant models of human disease. A number of good animal models have been developed to understand the pathophysiology. However, not all of them reflect the human disorder, a classic case being Usher's syndrome where the mutant mice do not have the same visual and auditory defects that patients face. There are others which have been even more difficult to model due to the multi-factorial nature of the condition and due to lack of discovery of a single causative gene such as age-related macular degeneration or Alzheimer's syndrome. Thus a more relevant and accurate system will allow us to make better predictions on relevant therapeutic approaches. The discovery of human pluripotent stem cells in 1998 followed by the technological advances to reprogram somatic cells to pluripotent-stem cell-like cells in 2006 has completely revolutionized the way we can now think about modelling human development and disease. This now coupled with genome editing technologies such as TALENS and CRISPRs have now set us up to develop in vitro models both 2D as well as 3D organoids, which can more precisely reflect the disease in the patients. These combinatorial technologies are already providing us with better tools and therapeutics in drug discovery or gene therapy. This book summarizes both the technological advances in the field of generation of patient specific lines as well as various gene editing approaches followed by its applicability in various systems. The book

will serve as a reference for the current state of the field as it: -Provides a comprehensive overview of the status of the field of patients derived induced pluripotent stem cells. - Describes the use of cardiac cells as a main featured component within the book. -Examines drug toxicity analysis as a working example throughout the book.

From Animals to Animats 8 Stefan Schaal,2004 New research on the adaptive behavior of natural and synthetic agents.

Advances In Animal Alternatives For Safety And Efficacy Testing Harry Salem,1997-11-12 Presents up-to-date concepts and approaches to the theory and practice of alternatives to animal testing and promotes technology transfer. The text addresses some of the ramifications of the National Institutes of Health Revitalization Act of 1993 which instructs the NIH to fund replacement, reduction and refinement alternatives. It also describes

Endocrine Pathology Ricardo V. Lloyd,2003-09-11 A comprehensive review of recent molecular discoveries that can clarify the pathophysiology of endocrine disease processes and contribute to the diagnostic aspects of endocrine pathology. Surgeons, medical oncologists, and radiation therapists discuss the treatment of endocrine disorders, especially tumors, with emphasis on differential diagnosis and on broadening the perspective that the endocrine pathologist must have in making specific tissue diagnoses. Of interest to practicing pathologists, pathology residents, endocrinologists, endocrinologists in training, veterinarians, and interested researchers.

New Developments in Lymphoma and Hodgkin's Disease Research Seth D. Tulviste, 2006 The lymphatic system plays a key role in fighting out the bacteria infested in the human body. More importantly, it aids in the fight against disease. Inside the lymphatic system, lymph vessels widen to produce lymph nodes. These lymph nodes usually appear under the arm or neck of those who are sick or infected. If cells continue to swell or multiply, they can often be considered as cancerous. Lymphoma is the actual type of cancerous cell that spreads throughout the lymphatic system. One main group of cells that spread within lymphatic system is Hodgkin's Disease, which is recognised by its growth of Reed-Sternberg cells. This book presents

cutting edge research from around the world.

Chemistry of Cell Interface Brown H. D.,1980

Cooperation of Liver Cells in Health and Disease Z.

Kmiec,2001-08-28 It is only during the last decade that the functions of sinusoidal endothelial cells, Kupffer cells, hepatic stellate cells, pit cells and other intrahepatic lymphocytes have been better understood. The development of methods for isolation and co-culturing various types of liver cells has established that they communicate and cooperate via secretion of various intercellular mediators. This monograph summarizes multiple data that suggest the important role of cellular cross-talk for the functions of both normal and diseased liver. Special features of the book include concise presentation of the majority of detailed data in 19 tables. Original schemes allow for the clear illustration of complicated intercellular relationships. This is the first ever presentation of the newly emerging field of liver biology, which is important for hepatic function in health and disease and opens new avenues for therapeutic interventions.

Immunology of Malignant Diseases V.S. Byers,R. W.

Baldwin,2012-12-06 Over the past 5 years, clinical immunology, as a whole, has advanced more rapidly than over the past 20 years. Many of these advances have been due to monoclonal antibody technology with its ability to identify antigens on tumour cells with a precision never before available. Monoclonal antibodies have the ability to identify subsets of human T-lymphocytes and aid in

diagnosis of both immunodeficiency disorders such as AIDS, or autoimmune diseases, and they can be adapted as drug targeting agents. Additionally, however, major advances have been made in identifying immunomodulating agents, and the last year has seen two such agents, IL-2 and OKT3, made available commercially for such intervention. Furthermore, another immuno modulating technique, bone marrow transplantation, has now been established as a curative modality in leukaemia treatment. A central issue in tumour immunology is whether human tumours express antigens which can be termed tumour-specific. This has important implications for both tumour immunity as well as drug targeting. This issue is considered in detail by R. A. Robins in the introductory chapter in which the expression of antigens in human tumours is compared with that in experimentally induced animal tumours. This controversial issue is also considered in later chapters by Bast in breast carcinoma, Riimke and de Vries in melanoma, V{mky in lung cancer, Armitage in colorectal cancer, and Paulie and Perlmann in bladder carcinoma.

Therapeutic targeting of circulating tumor cells

Michael R. King, There has been increased interest in circulating tumor cells (CTC), as a diagnostic readout of disease progression, and a tool for personalized medicine. The next generation of therapy for metastatic cancer may well involve neutralizing CTC as a means to prevent metastasis. In this topic we focus on recent research exploring this concept.

HIV & HTLV-I Associated Malignancies Joseph A. Sparano, 2012-12-06 Infection with the human immunodeficiency virus (HIV) and human T-cell lymphotropic virus type I (HTLV-I) is known to be associated with an increased risk of neoplastic disorders, especially Kaposi's sarcoma and aggressive B-cell lymphoma for the

former, and T-cell lymphoma for the latter. The information obtained from the study of these infections has led to remarkable advances in our understanding of the immune system, as well as the biology of human neoplasms. The management of malignant diseases in such patients also poses substantial challenges to clinicians. This book provides an overview of the epidemiology, biology, clinical features, and clinical management of neoplasms occurring in such individuals. It is an important resource for clinicians treating these diseases, and for basic scientists who have an interest in this field.
