Pharmacological Aspects of Ligand-gated Ion Channels as Targets of Natural and Synthetic Agents

César Mattei, Christian Legros, Richard J. Lewis, Helene Tricoire-Leignel, Jordi Molgo, 2022-05-11

Opponent Process and Nicotine Addiction Shelly Suzanne Watkins, 2000

The Brain as a Chemical Machine Jean-Pierre Changeux, Stuart J. Edelstein, 2005-04-01
The purpose of this book is to give a clear and straightforward account of the remarkable properties of the nicotinic receptor for acetylcholine, a membrane protein involved in chemical transduction in the nervous system that is also the target of a widely used drug, nicotine. This molecule also happens to be the

first pharmacological receptor and ion channel ever to have been identified. Jean-Pierre Changeux has played a leading role with Stuart J. Edelstein in the investigation of nicotinic acetylcholine receptors and allosteric proteins. The aim of this book is not only to review the most recent experimental and theoretical breakthroughs in the study of the nicotinic receptor, but also to give the reader a sense of the intellectual excitement and adventure that accompanied the various stages of discovery. This richly illustrated volume furnishes an exceptional opportunity for scientists and students to follow the course of a major advance in our understanding of the molecular basis of brain functions. Jean-Pierre Changeux is honorary professor at the Collège de France and at the Institut Pasteur, a member of the French Academy of Sciences. In addition to *L'Homme neuronal* [Neuronal Man] he is the author of *Raison et Plaisir* and *L'Homme de vérité*. He is also co-author, with Alain Connes, of *Matière à penser* [Conversations on Mind, Matter, and Mathematics] and, with Paul Ricœur, of *La Nature et la Règle* [What Makes Us Think?]. All thought-provoking works. Stuart J. Edelstein is Professor of Biochemistry at the University of Geneva and a foreign associate member of the Academy of Sciences. The nicotinic acetylcholine receptor has served for many decades as the prototype for neurotransmitter receptors. Acetylcholine was the first neurotransmitter shown to be involved in the function of the mammalian brain and its nicotinic receptor the first receptor to be characterized. Jean-Pierre Changeux is the indisputable pioneer

in this field. This volume summarizes with great lucidity the history of a highly important topic in neuroscience. Paul Greengard, Nobel laureate in Medicine - The Rockefeller University From the molecule to thought itself - an extraordinary journey! Changeux and Edelstein are uniquely qualified to relate this utterly fascinating story, whose philosophical implications are no less important than the scientific research underlying them. Jean-Marie Lehn, Nobel laureate in Chemistry - ISIS-Université Louis Pasteur, Strasbourg The human brain is as much a chemical as an electrical network. Its intricacy and sophistication set it apart from any known technical device. The groundbreaking papers by Monod, Jacob, Wyman, and Changeux in the 1960s on chemical regulation and control were eye-opening for all us who were doing experimental research in this field, and they have turned out to be crucial for understanding biological evolution and learning in a broad sense. Since then Changeux and Edelstein have achieved international fame for their work on nicotinic acetylcholine receptors, amply documented in this masterful account. Manfred Eigen, Nobel laureate in Chemistry - Max Planck Institute for Biophysical Chemistry, Göttingen One hesitates to call this book a monograph, for despite its comprehensive treatment of a complex subject it is not meant solely for specialized readers. In concentrating on a single class of neuroreceptors, the nicotinic acetylcholine receptor, it seeks to draw out general principles which apply more widely. It will therefore be welcomed not only by serious

workers and students in the field of neurobiology, but also by anyone interested in the broader field of neuroscience. Sir Aaron Klug OM FRS, Nobel laureate in Chemistry - University of Cambridge Changeux and Edelstein have provided a concise yet highly comprehensive account of perhaps the prototypical neurotransmitter complex, the nicotinic acetylcholine receptor. The story of how the roles played by this signal transduction system in nicotine dependence, learning, memory, and the processes of cognition came to be unraveled is an exciting saga, both beautiful and profound. A lovely historico-scientific document. Floyd E. Bloom, Professor Emeritus - The Scripps Research Institute Changeux and Edelstein describe a classically Cartesian process of scientific investigation that leads to a most non-Cartesian conclusion. Having elucidated the mechanisms of action and interaction by which the various elements that make up the nicotinic acetylcholine receptor operate throughout the nervous system, from neuromuscular junctions to the brain itself, the authors turn to the role of these structures and mechanisms in supporting cognition and giving access to consciousness - thus parting ways with Descartes and the view that the mind is able somehow to exist independently of the body. A work of truly remarkable erudition and insight. Roger Guillemin, Nobel laureate in Medicine - Salk Institute for Biological Studies "This book is unlike any recent scientific book. It is more like a forty-year research meeting in one of the world's most creative neurobiology laboratories—an intellectual tour de fortcheat surveys the

developmental trends and achievements of twentieth-century neuroscience in molecular, structural, and functional terms. The book therefore becomes an extraordinary educational saga, moving from Sir Henry Dale's pharmacology of nicotine to genetic diseases involving mutations of the cation channel function of nicotinic acetylcholine receptors. Research into these archetypal proteins has been carried out by pharmacologists, biochemists, molecular biologists, electrophysiologists, behavioral scientists, and geneticists, with Jean-Pierre Changeux and his coworkers participating in every aspect of this remarkable inquiry. Nicotinic acetylcholine receptors are the workhorse of the fast actions of the chemical signal acetylcholine, abundantly transmitted in both the peripheral and the central nervous system. Thanks to their variable sub- unit composition they come in many flavors, mediating control of voluntary muscles in the periphery and helping to regulate reward functions, cognition, and memory in the brain. This rich functionality leads the authors to describe models of neuromuscular junction development as well a global workspace model of cognitive function and its role in effortful learning. The nicotinic acetylcholine receptor was among the first ligand-gated ion channels to be sequenced and studied by patch-clamp methods. It has been the object of neurobiological research in England, France, Germany, Japan, and the United States, with contributions of equal weight being made by many teams of researchers over a number of decades, all carefully chronicled and explained by

the authors. This book is to be highly recommended to young scientists who want to discover into how many fields a single protein molecule can take them—from snake venom action to myasthenia gravis, addiction, learning, and schizophrenia—if they are willing patiently to learn new research techniques rather than specialize in a single method or instrument. To investigate the nicotinic acetylcholine receptor in all its aspects requires a Renaissance mind, and it is exactly this that Changeux and Edelstein have brought to bear on one of the most studied topics in neuroscience of the last century.” TAMAS BARTFAI, Chair and Professor, Department of Neuropharmacology The Scripps Research Institute

Understanding Nicotine and Tobacco Addiction

Gregory R. Bock, Jamie A. Goode, 2006-06-14

Cigarette smoking is estimated to lead to 4.9 million premature deaths per year worldwide. This is predicted to rise to 10 million by 2020. In western countries it kills half of all smokers who fail to stop. The prevailing model for tobacco addiction is that nicotine from cigarettes rewards smoking and punishes abstinence, tapping into a motivational system of operant conditioning that requires no conscious awareness. However, there are also accounts which involve cognitive biases and the effect of nicotine on impulse control. The brain pathways involved have been studied extensively, but the role of different nicotine receptor subtypes and other neurotransmitter systems is still subject to debate. In western countries, cigarette smoking as an adult has a heritability of 30-50% and candidate genes have

been identified that may contribute in part to addiction susceptibility. Many socio-cultural correlates of cigarette smoking have been established, but a comprehensive model that accounts for these and links them with the psychobiological aspects of nicotine addiction has not been forthcoming. Structured behavioural support programmes aid cessation attempts, as do a number of pharmacotherapies, most notably nicotine replacement treatments and bupropion, but the underlying mechanisms are unclear. This book deals with the problems involved in understanding and treating nicotine and tobacco addiction. Topics covered include the nature of the worldwide health problem posed by cigarette smoking, the psychodynamics of cigarette addiction, and the basic pharmacology and biochemistry of nicotine and its effect on the brain. Further chapters analyse the genetic basis of susceptibility to nicotine addiction. Finally, the contributors address approaches to therapy. A continuing theme in the discussions throughout the book is how best to treat nicotine addiction, given that many smokers would like to stop smoking but are unable to do so because of their addiction. This book will be of great value to all psychologists and psychiatrists working on addiction, specifically to nicotine but also to other compounds and behaviours. It will also be of interest to neuroscientists and pharmacologists working on nicotine receptors and the brain pathways involved in dependence, as well as to biochemists, molecular biologist and to public health officials.

Physiology and Genetics Timm Anke, Daniela Weber, 2009-09-18 In the last decade the discipline of mycology has been substantially changed by new research technologies. In particular DNA-based tools for the investigation of fungal taxonomy, signal transduction and regulation, and biosynthetic potential have accelerated advances in mycological knowledge. This volume presents a selection of exciting issues on basic and applied aspects of fungal physiology and genetics. In 18 chapters renowned experts provide an overview of traditional as well as current and future aspects of potential application of fungi in biotechnology. The contributions can be used by scientists to keep up-to-date on the latest developments in the corresponding research area, and by students to familiarize themselves with the different topics.

Nutrients, Stress and Medical Disorders Shlomo Yehuda, David I. Mostofsky, 2007-11-17 A benchmark survey of current clinical findings on the complex interactions between diet, stress, and mental health, and their impact on disease states. The authors give special attention to the influence of stress on physical health, mental health, and cognitive function, including the critical effects of maternal nutritional status and stress levels on fetal physical and mental development, the role of lipids in the development and treatment of depression, the role of fish oil in the development of aggressive behaviors, and the consequences of obesity on stress and the development of eating disorders. Additional chapters examine the effects of stress on chronic disorders, women, and cardiac function, and the influence of inflammation on diet, neurological functions, disease incidence, and cognitive functions.
