Similarity Solutions for the Boundary Layer Flow and Heat Transfer of Viscous Fluids, Nanofluids, Porous Media, and Micropolar Fluids John H. Merkin,Ioan Pop,Yian Yian Lok,Teodor Grosan,2021-09-09 Similarity Solutions for the Boundary Layer Flow and Heat Transfer of Viscous Fluids, Nanofluids, Porous Media, and Micropolar Fluids presents new similarity solutions for fluid mechanics problems, including heat transfer of viscous fluids, boundary layer flow, flow in porous media, and nanofluids due to continuous moving surfaces. After discussing several examples of these problems, similarity solutions are derived and solved using the latest proven methods, including bvp4c from MATLAB, the Keller-box method, singularity methods, and more. Numerical solutions and asymptotic results for limiting cases are also discussed in detail to investigate how flow develops at the leading edge and its end behavior. Detailed discussions of mathematical models for boundary layer flow and heat transfer of micro-polar fluid and hybrid nanofluid will help readers from a range of disciplinary backgrounds in their research. Relevant background theory will also be provided, thus helping readers solidify their computational work with a better understanding of physical phenomena. Provides mathematical models that address important research themes, such as boundary layer flow and heat transfer of micro-polar fluid and hybrid nanofluid Gives detailed numerical explanations of all solution procedures, including bvp4c from MATLAB, the Keller-box method, and singularity methods Includes examples of computer code that will save readers time in their own work

Numerical Solutions for Supersonic Flow of an Ideal Gas Around Blunt Two-dimensional Bodies Franklyn B. Fuller,1961

Numerical Solutions of the Euler Equations for Steady Flow Problems Albrecht Eberle,Arthur Rizzi,Ernst Heinrich Hirschel,2013-04-17 The last decade has seen a dramatic increase of our abilities to solve numerically the governing equations of fluid mechanics. In design aerodynamics the classical potential-flow methods have been complemented by higher modelling-level methods. Euler solvers, and for special purposes, already Navier-Stokes solvers are in use. The authors of this book have been working on the solution of the Euler equations for quite some time. While the first two of us have worked mainly on algorithmic problems, the third has been concerned off and on with modelling and application problems of Euler methods. When we started to write this book we decided to put our own work at the center of it. This was done because we thought, and we leave this to the reader to decide, that our work has attained over the years enough substance in order to justify a book. The problem which we soon faced, was that the field still is moving at a fast pace, for instance because hyper sonic computation problems became more and more important.

Supersonic Near Free Molecule Flow Over a Specularly Reflecting Flat Plate with a Deflected Flap Charles R. Ortloff,1966 The two-dimensional supersonic low-density flow over a flat plate with a deflected flap is analyzed both for free molecules and small collision frequency cases. Solutions for the expansion and compression flows over the corner, as well as the wake region, are given for the case of specular wall reflection. Numerical results are given for Mach numbers of 3, 6, and 12 for the free molecule macroscopic number density, velocity, and temperature. Additional solutions are given for the finite collision frequency case for a Mach number of 3 and a Knudsen number of 5. The solutions indicate the extent of the upstream influence regions and the downstream wake regions as a function of the product of flap angle and free stream Mach number for a given Knudsen number. Results for the lift/drag ratio and the lift curve slope of the plate-flap configuration are also given as a function of Knudsen number. On the basis of the above results, flap effectiveness over a range of Knudsen numbers in the low density regime is determined. (Author).

Turbulent Flows S. B. Pope,2000-08-10 This is a graduate text on turbulent flows, an important topic in fluid dynamics. It is up-to-date, comprehensive, designed for teaching, and is based on a course taught by the author at Cornell University for a number of years. The book consists of two parts followed by a number of appendices. Part I provides a general introduction to turbulent flows, how they behave, how they can be described quantitatively, and the fundamental physical processes involved. Part II is concerned with different approaches for modelling or simulating turbulent flows. The necessary mathematical techniques are presented in the appendices. This book is primarily intended as a graduate level text in turbulent flows for engineering students, but it may also be valuable to students in applied mathematics, physics, oceanography and atmospheric sciences, as well as researchers and practising engineers.
