Risk profile - Group B Streptococcus (GBS) -? Streptococcus agalactiae sequence type (ST) 283 in freshwater fish Food and Agriculture Organization of the United Nations,2021-06-11 In Singapore during 2015, Group B Streptococcus (GBS) sequence type 283 (ST283) caused the only reported foodborne outbreak of invasive GBS disease. Over 20 percent of cases were healthy adults without comorbidities, which is unusual for GBS. The outbreak was linked to the consumption of raw freshwater fish. Subsequent investigations found that ST283 GBS has been common among GBS causing disease in humans and in tilapia across Southeast Asia for at least 20 years, whereas it was almost non-existent outside this region. Given the novelty of the outbreak, this risk profile consolidates the current knowledge to identify data gaps about GBS ST283 along the freshwater fish supply chain in Southeast Asia. Although GBS fish infection can present with few clinical signs of disease, outbreaks of GBS in high intensity tilapia aquaculture can result in severe infection with mortalities of up to 80 percent. These outbreaks are largely undocumented but likely have a wide effect on aquaculture, given its economic and social importance across Southeast Asia. There is also a lack of data on patterns of fish consumption, including frequency, amount, preparation and consumer demographics. Nevertheless, consumption of non-heat-treated freshwater fish is common in Southeast Asia. Given the multitude of data gaps, the risk posed by GBS ST283 from consumption of freshwater fish remains highly uncertain. Potential risk management options start with the application of good aquaculture practices and good food safety measures throughout the supply chain.

**Monoclonal Antibodies against Bacteria** Alberto Macario,2012-12-02 Monoclonal Antibodies against Bacteria, Volume I explores the generation, characterization, and utilization of monoclonal antibodies against bacteria and on other monoclonal products relevant to antibacterial immune responses. Organized into 12 chapters, this book begins with a discussion on monoclonal antibodies against bacteria, encompassing its scope, research, and directions. It shows that the coordinated use of antisera and panels of monoclonal antibodies is proving useful for classification as a diagnostic tool with prognostic implications in the case of pathogens, or as a preliminary step in taxonomy. Also, monoclonal antibodies hold great potential as instruments in working with bacteria for industrial or biotechnological purposes, including genetic engineering. This book also elucidates the use of monoclonal antibodies of predefined molecular specificity for tracing molecular signatures left by a given strain in other microorganisms, subcellular structures, and materials from ecologic niches. The possibility of antibacterial and antitoxin therapies with monoclonal antibodies is also addressed. This treatise will be a valuable reference work to anyone working with monoclonal antibodies or getting ready to prepare them against the strain(s) (or bacterial structures) of his/her interest.
