Adaptation in Plant Breeding P.M.A Tigerstedt,2013-03-09 Plant adaptation is a fundamental process in plant breeding. It was the first criterion in the initial domestication of plants thousands of years ago. Adaptedness is generally a quantitative complex feature of the plant, involving many traits, many of which are quantitative. Adaptation to stresses like cold, drought or diseases are among the most central problems in a world grappling with global food security. Modern plant breeding, based on mendelian genetics, has made plant improvement more effective and more precise and selective. Molecular genetics and genetic engineering has considerably increased this selectivity down to single genes affecting single traits. The time has come when plant breeding efficiency may cause loss of genetic resources and adaptation. In these proceedings an effort is made to merge modern plant breeding efficiency with ecological aspects of plant breeding, reflected

in adaptation. It is hoped that this merger results in more sustainable use of genetic resources and physical environments. The book is based on 10 keynotes addressing a wide spectrum of themes related to adaptation. In addition each subject is further elaborated in up to three case studies on particular plant species or groups of plants. The keynotes do in fact overlap to some degree and there are articles in this volume that seemingly contradict each other, a common aspect in advanced fields of research. The keen reader may conclude that, in a world where climates and environments are under continuous change and where human society is more and more polarized into a developed and a developing part, adaptation of our cultivated plants has different constraints on yields depending on ecology, and indeed economy.

**Industrial Applications of Semantic Web** Vagan Terziyan, 2006-03-09 The Semantic Web, that adds a conceptual layer of machine-understand able metadata to the existing content, will make the content available for processing by intelligent software allowing automatic resource integration and providing interoperability between heterogeneous systems. The Semantic Web is now the most important influence on the development of the Web. Next generation of intelligent applications will be capable to make use of such metadata to perform resource discovery and integration based on its semantic. Semantic Web, aims at developing a global environment on top of Web with interoperable heterogeneous applications, agents, web services, data repositories, humans, and so on. On the technology side, Web-oriented languages and technologies are being developed (e.g. RDF, OWL, OWL-S, WSMO, etc.), and the success of the Semantic Web will depend on a wide spread industrial adoption of these technologies. Trend within worldwide activities related to Semantic Web definitely shows that the technology has emerging growth of interest both academic and industry during a relatively small time interval.

**Software Business** Pasi Tyrväinen, Slinger Jansen, Michael A. Cusumano, 2010-06-18 The advancement of the software industry has had a substantial impact not only on productivity and on GDP growth globally, but also on our daily work and life. Software business refers to commercial activity of the software industry, aimed at generating income from delivery of software products and software services. Although software business shares common features with other international knowledge-intensive businesses, it carries many inherent features making it an intriguing and challenging domain for research. Until now, however, software business has received little attention from the academic community. The First International Conference on Software Business (ICSOB 2010) was organized in Jyväskylä during June 21-23, 2010. This inaugural conference brought together a strong Program Committee of 52 members with research disciplines from various fields of business management and technology management as well as international, with members coming from 17 countries from South and North America to Europe, India and Australia.

We received 35 research paper submissions. The papers went through a double-blind review process producing at least three reviews for each accepted paper. The Program Committee accepted 13 submissions to be presented as full papers in the conference, equaling 37% of the submissions. In addition, ten papers were accepted as short papers. The accepted papers represent the wide variety of research activity on software business. For the purposes of the conference program, the papers were organized under eight themes: business models, business management, ecosystems, education and research, internationalization, open source software and social media, product management, and software as a service. In addition to the paper sessions, the conference program included three

keynote presentations and a Business Innovation Track containing best-practice presentations from the software industry. The conference program also included two workshops, three tutorials and an adjunct meeting of the Cloud Software Consortia.

**Politics of Scale** Tuuli Lähdesmäki, Suzie Thomas, Yujie Zhu, 2019-01-02 Critical Heritage Studies is a new and fast-growing interdisciplinary field of study seeking to explore power relations involved in the production and meaning-making of cultural heritage. Politics of Scale offers a global, multi- and interdisciplinary point of view to the scaled nature of heritage, and provides a theoretical discussion on scale as a social construct and a method in Critical Heritage Studies. The international contributors provide examples and debates from a range of diverse countries, discuss how heritage and scale interact in current processes of heritage meaning-making, and explore heritage-scale relationship as a domain of politics.

**Theory and Applications of Ontology: Computer Applications** Roberto Poli, Michael Healy, Achilles Kameas, 2010-09-02 Ontology was once understood to be the philosophical inquiry into the structure of reality: the analysis and categorization of 'what there is'. Recently, however, a field called 'ontology' has become part of the rapidly growing research industry in information technology. The two fields have more in common than just their name. Theory and Applications of Ontology is a two-volume anthology that aims to further an informed discussion about the relationship between ontology in philosophy and ontology in information technology. It fills an important lacuna in cutting-edge research on ontology in both fields, supplying stage-setting overview articles on history and method, presenting directions of current research in either field, and highlighting areas of productive interdisciplinary contact. Theory and Applications of Ontology:

Computer Applications presents ontology in ways that philosophers are not likely to find elsewhere. The volume offers an overview of current research in ontology, distinguishing basic conceptual issues, domain applications, general frameworks, and mathematical formalisms. It introduces the reader to current research on frameworks and applications in information technology in ways that are sure to invite reflection and constructive responses from ontologists in philosophy.

**Gaussian Processes for Positioning Using Radio Signal Strength Measurements** Yuxin Zhao,2019-02-27 Estimation of unknown parameters is considered as one of the major research areas in statistical signal processing. In the most recent decades, approaches in estimation theory have become more and more attractive in practical applications. Examples of such applications may include, but are not limited to, positioning using various measurable radio signals in indoor environments, self-navigation for autonomous cars, image processing, radar tracking and so on. One issue that is usually encountered when solving an estimation problem is to identify a good system model, which may have great impacts on the estimation performance. In this thesis, we are interested in studying estimation problems particularly in inferring the unknown positions from noisy radio signal measurements. In addition, the modeling of the system is studied by investigating the relationship between positions and radio signal strength measurements. One of the main contributions of this thesis is to propose a novel indoor positioning framework based on proximity measurements, which are obtained by quantizing the received signal strength measurements. Sequential Monte Carlo methods, to be more specific particle filter and smoother, are utilized for

estimating unknown positions from proximity measurements. The Cramér-Rao bounds for proximity-based positioning are further derived as a benchmark for the positioning accuracy in this framework. Secondly, to improve the estimation performance, Bayesian non-parametric modeling, namely Gaussian processes, have been adopted to provide more accurate and flexible models for both dynamic motions and radio signal strength measurements. Then, the Cramér-Rao bounds for Gaussian process based system models are derived and evaluated in an indoor positioning scenario. In addition, we estimate the positions of stationary devices by comparing the individual signal strength measurements with a pre-constructed fingerprinting database. The positioning accuracy is further compared to the case where a moving device is positioned using a time series of radio signal strength measurements. Moreover, Gaussian processes have been applied to sports analytics, where trajectory modeling for athletes is studied. The proposed framework can be further utilized to carry out, for instance, performance prediction and analysis, health condition monitoring, etc. Finally, a grey-box modeling is proposed to analyze the forces, particularly in cross-country skiing races, by combining a deterministic kinetic model with Gaussian process.

**Indefinite Inner Product Spaces** J. Bogner, 2012-12-06 By definition, an indefinite inner product space is a real or complex vector space together with a symmetric (in the complex case: hermitian) bilinear form prescribed on it so that the corresponding quadratic form assumes both positive and negative values. The most important special case arises when a Hilbert space is considered as an orthogonal direct sum of two subspaces, one equipped with the original inner product, and the other with  $-1$  times the original inner product. The subject first appeared thirty years ago in a paper of Dirac [1] on quantum field theory (cf. also Pauli [1]). Soon afterwards, Pontrjagin

[1] gave the first mathematical treatment of an indefinite inner product space. Pontrjagin was unaware of the investigations of Dirac and Pauli; on the other hand, he was inspired by a work of Sobolev [1], unpublished up to 1960, concerning a problem of mechanics. The attempts of Dirac and Pauli to apply the concept and elementary properties of indefinite inner product spaces to field theory have been renewed by several authors. At present it is not easy to judge which of their results will contribute to the final form of this part of physics. The following list of references should serve as a guide to the extensive literature: Bleuler [1], Gupta [1], Kallen and Pauli [1], Heisenberg [1]-[4], Bogoljubov, Medvedev and Polivanov [1], K.L. Nagy [1]-[3], Berezin [1], Arons, Han and Sudarshan [1], Lee and Wick [1].

**Nationalism and Internationalism Intertwined** Pasi Ihalainen, Antero Holmila, 2022-03-11 It is commonplace that the modern world is more international than at any point in human history. Yet the sheer profusion of terms for describing politics beyond the nation state—including “international,” “European,” “global,” “transnational” and “cosmopolitan,” among others – is but one indication of how conceptually complex this field actually is. Taking a wide view of internationalism(s) in Europe since the eighteenth century, Nationalism and Internationalism

Intertwined explores discourses and practices to challenge nation-centered histories and trace the entanglements that arise from international cooperation. A multidisciplinary group of scholars in history, discourse studies and digital humanities asks how internationalism has been experienced, understood, constructed, debated and redefined across different European political cultures as well as related to the wider world.
