The Oxford History of Board Games David Parlett,1999 For thousands of years, people have been planning attacks, captures, chases, and conquests - on a variety of different boards designed for an astonishing diversity of games. Today the compelling mix of strategy, skill, and chance is as strong as ever; new board games are invented almost daily, while the perennial favourites continue to attract new devotees and reveal new possibilities. The Oxford History of Board Games investigates the principles of board games throughout the ages and across the world, exploring the fascinating similarities and differences that give each its unique appeal, and drawing out the significance of game-playing as a central part of human experience - as vital to a culture as its music, dance, and tales. Beautifully illustrated and with diagrams to show the finer points of the games, this is a fascinating and accessible guide to a richly rewarding subject. In his trade-mark accessible, entertaining style, David Parlett looks at the different families of games: games based on configuration or connection, races or chases, wars or hunts, capture or blockade. He focuses mainly on traditional games, the folk entertainments that have grown up organically through the centuries, and which exhibit endless local variations, although he discusses also the commercial products that have tried, with varying degrees of success, to match their astonishing popularity. This is not primarily a how-to book, although the rules and strategies of certain games are discussed in detail, neither does it offer sure-fire tips for success, although with a fuller understanding of a game the reader will undoubtedly become a better-informed, if not better, player. Rather, it is an affectionate and authoritative survey of one of the most familiar parts of our cultural history, which has until now been inexplicably neglected.

Sugar and Spice, and Everything Nice: Exploring Prosocial Development Through Infancy and Early Childhood Chris Moore, Markus Paulus, Amanda Williams, 2015-05-18 Prosocial behaviors such as sharing, helping, and comforting begin to emerge early in development. The presence of these prosocial behaviors is important not only in childhood, but throughout one's lifetime, as behaving prosocially is important for social functioning and maintaining social relationships. For many years researchers have been interested in how and when these behaviors develop, as well as how these behaviors are influenced by a variety of factors. Recently however, exciting new research has shown novel and surprising findings, particularly on the early development and ontogenetic origins of prosocial behavior. Research in this area is important, as by understanding what influences prosocial behavior, we may be better able to sustain and support the development of prosociality. Further, a richer understanding may help us to be better able to mediate factors that impede or negatively influence positive social behaviors, as well as negative triggers that may lead to negative social behaviors. Many theoretical views guide different streams of developmental research in this field. Here, we will bring together scholars from various theoretical backgrounds, to collectively explore the development of early prosocial behaviors from early infancy to early school aged children. Contributors will offer insights using a variety of methodologies, from various resource allocation paradigms derived from economist game theorists, to looking time paradigms and more. Together we seek to broadly explore questions pertaining to prosocial development, for example- at what age do prosocial behaviors, moral understanding, or social selectivity emerge? Contributors will individually address unique research questions across a spectrum of topics. For example, how prosocial behaviors are influenced by underlying mechanisms, such as moral emotions (e.g. guilt and sympathy), will be explored, as will how children's expectations may shape their behaviors, and how they come to care about others. Questions surrounding different contexts will also be investigated. For example, how does empathy influence prosociality? Do children treat partners differently depending on their past behaviors, wealth, or other characteristics? Does whether there is a cost associated with behaving prosocially influence decision-making? By incorporating the work of numerous researchers in the field of prosocial development, who contribute comprehensive reviews of past research, unique theoretical perspectives and empirical approaches, the proposed research topic endeavors to provide new insights into a breadth of prosocial behaviors. In sum, the proposed research topic will contribute to our understanding of prosocial development in the early years by highlighting the relevant factors and contexts under which prosocial behavior emerges.

Made to Hear Laura Mauldin,2016-02-29 A mother whose child has had a cochlear implant tells Laura Mauldin why enrollment in the sign language program at her daughter's school is plummeting: "The majority of parents want their kids to talk." Some parents, however, feel very differently, because "curing" deafness with cochlear implants is uncertain, difficult, and freighted with judgment about what is normal, acceptable, and right. Made to Hear sensitively and thoroughly considers the structure and culture of the systems we have built to make deaf children hear. Based on accounts of and interviews with families who

adopt the cochlear implant for their deaf children, this book describes the experiences of mothers as they navigate the health care system, their interactions with the professionals who work with them, and the influence of neuroscience on the process. Though Mauldin explains the politics surrounding the issue, her focus is not on the controversy of whether to have a cochlear implant but on the long-term, multiyear undertaking of implantation. Her study provides a nuanced view of a social context in which science, technology, and medicine are trusted to vanquish disability—and in which mothers are expected to use these tools. *Made to Hear* reveals that implantation has the central goal of controlling the development of the deaf child's brain by boosting synapses for spoken language and inhibiting those for sign language, placing the politics of neuroscience front and center. Examining the consequences of cochlear implant technology for professionals and parents of deaf children, *Made to Hear* shows how certain neuroscientific claims about neuroplasticity, deafness, and language are deployed to encourage compliance with medical technology.
