**Satellite Observations of the Earth's Environment** National Research Council,Division on Earth and Life Studies,Board on Atmospheric Sciences and Climate,Division on Engineering and Physical Sciences,Aeronautics and Space Engineering Board,Space Studies Board,Committee on NASA-NOAA Transition from Research to Operations,2003-07-03 This report addresses the transition of research satellites, instruments, and calculations into operational service for accurately observing and predicting the Earth's environment. These transitions, which take place in large part between NASA and NOAA, are important for maintaining the health, safety, and prosperity of the nation, and for achieving the vision of an Earth Information System in which quantitative information about the complete Earth system is readily available to myriad users. Many transitions have been ad hoc, sometimes taking several years or even decades to occur, and others have encountered roadblocks—lack of long-range planning, resources, institutional or cultural differences, for instance—and never reached fruition. Satellite Observations of Earth's Environment recommends new structures and methods that will allow seamless transitions from research to practice.

**Evaluation of Infrared Emission of Clouds and Ground as Measured by Weather Satellites** Clifford Dalton Kern,1965 Of prime interest are the radiation data from that portion of the infrared spectrum known as the atmospheric water-vapor window, ranging from about 8 to 12 microns. Infrared signals received by weather satellites and aircraft depend, in clear air, on surface temperature, atmospheric interference and surface emissivity. For the latter, very different data in literature are found for clouds, water, rocks, etc. In this report correct emissivity data were sought in three ways: (1) Reflectivity of polished rock samples was tested in an infrared spectrograph for 5-16 microns wavelength. Using Kirchhoff's law this method yielded emissivities for near normal incidence. (2) Using an 8-13 microns sensitive radiometer and an aggregate, called emissivity box, the emissivity of many surfaces was measured directly. (3) A summer noon time flight of Tiros over the Mediterranean and the Sahara was evaluated.

*Controlled Processing of Direct Readout Data from Weather Satellites* Robert F. Myers,1970 Optimization of satellite pictures by standardizing the range of reflective density is accomplished by the use of a dynamic signal simulator which sweeps the amplitude of a 2400 Hz signal from 4 to -32 dBm providing a direct display of the crater tube current versus signal amplitude on an oscilloscope. The time required for setting up the standardizing function is reduced to a few minutes per day. Use of these techniques permits quantitative temperature measurements to be made from DRIR pictures with a densitometer. (Author).

**Climatology from Satellites** Eric Barrett,2019-10-28 Originally published in 1974, was a pioneering study which summarized, within the pre-existing framework of atmospheric knowledge, the more significant findings that emerged from the first decade of climatological analyses of meteorological satellite data. It shows how these data complement and extend the traditional coverage of climatology. The book draws together in one volume research findings which were not previously available in book form and which significantly improve the understanding of climate, especially in regions that were conventionally data-remote.

**From Research to Operations in Weather Satellites and Numerical Weather Prediction** National Research Council,Commission on Geosciences, Environment, and Resources,Board on Atmospheric Sciences and Climate,2000-08-07 This workshop report examines the capability of the forecast system to efficiently transfer weather and climate research findings into improved operational forecast capabilities. It looks in particular at the Environmental Modeling Center of the National Weather Service and environmental observational satellite programs. Using these examples, the report identifies several shortcomings in the capability to transition from research to operations. Successful transitions from R&D to operational implementation requires (1) understanding of the importance (and risks) of the transition, (2) development and maintenance of appropriate transition plans, (3) adequate resource provision, and (4) continuous feedback (in both directions) between the R&D and operational activities.
