The papers are organized in topical sections on model transformation, model complexity, aspect oriented modeling, analysis and comprehension of models, domain specific modeling, models for embedded systems, model synchronization, model based resource management, analysis of class diagrams, verification and validation, refactoring models, modeling visions, logics and modeling, development methods, and model integration and collaboration.

Extracellular Matrix Genes Charles Boyd,2012-12-02 Extracellular Matrix Genes provides some of the interesting complexities of the structure of the entire family of extracellular matrix genes. This book illustrates the permanent role that molecular biology and molecular genetics play in the detailed understanding of the normal biology of extracellular matrix. Organized into 10 chapters, this book begins with an overview of the structural and sequence aspects of the entire family of genomic sequences with a view to establishing common functional domains among collagens and their genes. This text then examines the status of the literature concerning human types. III and V. Other chapters consider the FACIT collagen gene family. This book discusses as well the development in understanding the structure of small proteoglycan core proteins and their role in proteoglycan biosynthesis and function as a result of their molecular cloning and expression. The final chapter deals with mutations in collagen genes. This book is a valuable resource for biochemists.

Pertussis Toxin Ronald Sekura,2012-12-02 Pertussis Toxin presents the proceeding of the Pertussis Toxin Conference, held in Bethesda, Maryland, on September 20–21, 1984. This book discusses the perspective of the pertussis toxin and the potential role of the toxin in the development of new acellular pertussis vaccines. Organized into 13 chapters, this text begins with an overview of the biological activities of pertussis vaccine, which enhanced the production of antibodies to antigens. This book then examines the interesting action of pertussis vaccine to stimulate antibody production, particularly as an effective adjuvant for the production of IgE isotype of antibodies. Other chapters consider the experimental approaches used in the study of the mechanisms by which hormones produce their physiological effect. The final chapter examines the several features of the Bordetella adenylate cyclase toxin, which suggest that the molecule may follow the A/B model proposed for a number of bacterial toxins. This book is a valuable resource for toxicologists, immunologists, bacteriologists, and pharmacologists.

Option Pricing and Estimation of Financial Models with R Stefano M. Iacus, 2011-02-23 Presents inference and simulation of stochastic process in the field of model calibration for financial times series modelled by continuous time processes and numerical option pricing. Introduces the bases of probability theory and goes on to explain how to model financial times series with continuous models, how to calibrate them from discrete data and further covers option pricing with one or more underlying assets based on these models. Analysis and implementation of models goes beyond the standard Black and Scholes framework and includes Markov switching models, Lévy models and other models with jumps (e.g. the telegraph process); Topics other than option pricing include: volatility and covariation estimation, change point analysis, asymptotic expansion and classification of financial time series from a statistical viewpoint. The book features problems with solutions and examples. All the examples and R code are available as an additional R package, therefore all the examples can be reproduced.

Concurrent Programming: Algorithms, Principles, and Foundations Michel Raynal, 2012-12-30 This book is devoted to the most difficult part of concurrent programming, namely synchronization concepts, techniques and principles when the cooperating entities are asynchronous, communicate through a shared memory, and may experience failures. Synchronization is no longer a set of tricks but, due to research results in recent decades, it relies today on sane scientific foundations as explained in this book. In this book the author explains synchronization and the implementation of concurrent objects, presenting in a uniform and comprehensive way the major theoretical and practical results of the past 30 years. Among the key features of the book are a new look at lock-based synchronization (mutual exclusion, semaphores,

monitors, path expressions); an introduction to the atomicity consistency criterion and its properties and a specific chapter on transactional memory; an introduction to mutex-freedom and associated progress conditions such as obstruction-freedom and wait-freedom; a presentation of Lamport's hierarchy of safe, regular and atomic registers and associated wait-free constructions; a description of numerous wait-free constructions of concurrent objects (queues, stacks, weak counters, snapshot objects, renaming objects, etc.); a presentation of the computability power of concurrent objects including the notions of universal construction, consensus number and the associated Herlihy's hierarchy; and a survey of failure detector-based constructions of consensus objects. The book is suitable for advanced undergraduate students and graduate students in computer science or computer engineering, graduate students in mathematics interested in the foundations of process synchronization, and practitioners and engineers who need to produce correct concurrent software. The reader should have a basic knowledge of algorithms and operating systems.
