Foundations of Information and Knowledge Systems Thomas Eiter, Klaus-Dieter Schewe, 2003-07-31 This volume contains the papers presented at the “Second International Symposium on Foundations of Information and Knowledge Systems” (FoIKS 2002), which was held in Schloß Salza, Germany from February 20th to 23rd, 2002. FoIKS is a biennial event focusing on theoretical foundations of information and knowledge systems. It aims to bring together researchers working on the theoretical foundations of information and knowledge systems and to attract researchers working in mathematical fields such as discrete mathematics, combinatorics, logics, and finite model theory who are interested in applying their theories to research on database and knowledge base theory. FoIKS took up the tradition of the conference series “Mathematical Fundamentals of Database Systems” (MFDBS) which enabled East-West collaboration in the field of database theory. The first FoIKS symposium was held in Burg, Spreewald (Germany) in 2000. Former MFDBS conferences were held in Dresden (Germany) in 1987, Visegrád (Hungary) in 1989, and in Rostock (Germany) in 1991. Proceedings of these previous events were published by Springer-Verlag as volumes 305, 364, 495, and 1762 of the LNCS series. In addition the FoIKS symposium is intended to be a forum for intensive discussions. For this reason the time slot of long and short contributions is 60 and 30 minutes respectively, followed by 30 and 15 minutes for discussions, respectively. Furthermore, participants are asked in advance to prepare as correspondents to a contribution of another author. There are also special sessions for the presentation and discussion of open research problems.

Communication Technology Update August E. Grant, Ashley J. Bennington, 2014-05-16 Communication Technology Update, Third Edition provides the latest information on as many communication technologies as possible, using as many specific statistics on market share, units sold, etc., as possible to allow comparison among the technologies. This book is designed to help make sense of the spectrum of communication technologies. The text explores the widest possible range of technologies, from broadcast to telephony and from wired to wireless. In discussing each

technology, this book will not only deal with the hardware of the technology, but also with the software, organizational structure, political and economic influences, and individual users of the technologies. Major developments in each of these areas are presented for each technology, along with background information to help explain the major factors in the evolution of the technology. The first chapter begins by defining communication technology and introducing the umbrella perspective used to present and analyze each technology. Following this discussion, an overview of the remainder of the book is presented. This book targets two groups of users. One of which is the group of communication professionals who have a desire to keep up with the latest developments both within and adjacent to their particular fields. Second is the group of students who are studying communication technology and need information that is more current than that provided by a textbook and more comprehensive than that found in trade magazines.

Routing Strategies in Ad-hoc Wireless Networks Jyoti Raju, 2002 Ad-hoc wireless networks present a unique design problem for routing. Wireless networks suffer from low bandwidth due to high rates of interference and inherent limitations of the medium. Mobility also increases the bandwidth used for control packets. To conserve on precious bandwidth, routing protocols should generate as few updates as possible. In this dissertation, we propose distance vector solutions to ad-hoc routing because unlike existing routing solutions our solutions do not use sequence numbers and thus are not prone to inefficient or wrong behavior in the presence of node failures. First, we introduce ROAM, the first protocol to correctly tackle the searching to infinity problem found in on-demand routing protocols. ROAM can be used in networks with low rates of topology changes because it required reliable updates. Next, we describe two protocols DST (on-demand) and BEST (table-driven) for networks with high rates of topology change. Simulation experiments carried out in two different simulation packages show that these protocols perform an order of magnitude better than representative on-demand and table-driven routing solutions for ad-hoc networks. Finally, we introduce MDST, an on-demand protocol that extends the source tracing algorithm used in DST to create and maintain multiple paths in an ad-hoc wireless network. Multipath routing can be used in ad hoc networks to achieve greater resilience to route failures and better end-to-end delays. Multipath routing is also essential when using QoS metrics like delay in order to avoid route oscillation. We show that multiple paths that are node disjoint and loop free can be maintained with less overhead than DST. Further, these multiple paths decrease the delay of packet delivery and increase the throughput of the network.
