Future Space-Transport-System Components under High Thermal and Mechanical Loads Nikolaus A. Adams,Wolfgang Schröder,Rolf Radespiel,Oskar J. Haidn,Thomas Sattelmayer,Christian Stemmer,Bernhard Weigand,2020-10-26 This open access book presents the findings of Collaborative Research Center Transregio 40 (TRR40), initiated in July 2008 and funded by the German Research Foundation (DFG). Gathering innovative design concepts for thrust chambers and nozzles, as well as cutting-edge methods of aft-body flow control and propulsion-component cooling, it brings together fundamental research undertaken at universities, testing carried out at the German Aerospace Center (DLR) and industrial developments from the ArianeGroup. With a particular focus on heat transfer analyses and novel cooling concepts for thermally highly loaded structures, the book highlights the aft-body flow of the space transportation system and its interaction with the nozzle flow, which are especially critical during the early phase of atmospheric ascent. Moreover, it describes virtual demonstrators for combustion chambers and nozzles, and discusses their industrial applicability. As such, it is a timely resource for researchers, graduate students and practitioners.

Transport in Plants II U. Lüttge,M.G. Pitman,2012-12-06 As plant physiology increased steadily in the latter half of the 19th century, problems of absorption and transport of water and of mineral nutrients and problems of the passage of metabolites from one cell to another were investigated, especially in Germany. JUSTUS VON LIEBIG, who was born in Darmstadt in 1803, founded agricultural chemistry and developed the techniques of mineral nutrition in agriculture during the 70 years of his life. The discovery of plasmolysis by NAGEL! (1851), the investigation of permeability problems of artificial membranes by TRAUBE (1867) and the classical work on osmosis by PFEFFER (1877) laid the foundations for our understanding of soluble substances and osmosis in cell growth and cell mechanisms. Since living membranes were responsible for controlling both water movement and the substances in solution, permeability became a major topic for investigation and speculation. The problems then discussed under that heading included passive permeation by diffusion, Donnan equilibrium adjustments, active transport processes and antagonism between ions. In that era, when organelle isolation by differential centrifugation was unknown and the electron microscope had not been invented, the number of cell membranes, their thickness and their composition, were matters for conjecture. The nature of cell surface membranes was deduced with remarkable accuracy from the reactions of cells to substances in solution. In 1895, OVERTON, in U. S. A. , published the hypothesis that membranes were probably lipid in nature because of the greater penetration by substances with higher fat solubility.

Global Dynamics, Phase Space Transport, Orbits Homoclinic to Resonances, and Applications Stephen Wiggins, This monograph, which grew out of a series of lectures delivered by Stephen Wiggins at the Fields Institute in early 1993, is concerned with the geometrical viewpoint of the global dynamics of nonlinear dynamical systems. With appropriate examples and concise explanations, Wiggins unites many different topics into one volume and makes a unique contribution to the field. Engineers, physicists, chemists, and mathematicians who work on issues related to the global dynamics of nonlinear dynamical systems will find these lectures very useful.

Space and Transport in the World-System Stephen G. Bunker,Paul S. Ciccantell,1998-02-28 Key metaphors in world-system analysis are profoundly spatial, but there have been few attempts to understand how space, location, and topography affect world-system organization and process. To fill this gap, this book examines case studies of the restructuring of space and transport in core, semiperipheral, and peripheral economies. It addresses such topics as the role of ocean transport in linking terrestrially based units of the capitalist world economy, the role of land transport systems in the construction and restructuring of relationships between raw materials peripheries and core economies, and the role of the airplane in transforming and representing changing spatial, economic, and social relations in the capitalist world economy. World-systems theory and many other perspectives on the world economy, including international political economy and analysis of globalization, typically pay only limited attention to issues of space, location, and the role of transportation in the world economy. This book identifies key theoretical and empirical issues and provides the basis for formulating research strategies to address this gap in our understanding.

Space Transport Liability:National and International Aspects R. Bender,1995-10-05 Space Transport Liability examines the national and international space transport liability principles which govern personal injury, property damage, and cargo losses caused by spacecraft. The value of maritime, aviation, and general transport analogies and law is considered. The book then considers the proper parties, forums, law, and precedents available to resolve space transport disputes. This book is as much about what space transport law will be as what it is. It will interest legislators as well as lawyers. It will assist space transport participants to structure their agreements and resolve their disputes. The cases described will assist insurers in underwriting space risks and venture capitalists in hedging their bets. For students of law, it will extend conventional principles to unconventional situations.

Social Change and Sustainable Transport William Richard Black,Peter Nijkamp,2002-11-29 Transportation research has traditionally been dominated by engineering and logistics research approaches. This book integrates social, economic, and behavioral sciences into the transportation field. As its title indicates, emphasis is on socioeconomic changes, which increasingly govern the development of the transportation sector. The papers presented here originated at a conference on Social Change and Sustainable Transport held at the University of California at Berkeley in March 1999, under the auspices of the European Science Foundation and the National Science Foundation. The contributors, who represent a range of disciplines, including geography and regional science, economics, political science, sociology, and psychology, come from twelve different countries. Their subjects cover the consequences of environmentally sustainable transportation vs. the business-as-usual status quo, the new phenomenon of edge cities, automobile dependence as a social problem, the influence of leisure or discretionary travel and of company cars, the problems of freight transport, the future of railroads in Europe, the imposition of electronic road tolls, potential transport benefits of e-commerce, and the electric car.

Computational Models for Polydisperse Particulate and Multiphase Systems Daniele L. Marchisio,Rodney O. Fox,2013-03-28 Providing a clear description of the theory of polydisperse multiphase flows, with emphasis on the mesoscale modelling approach and its relationship with microscale and macroscale models, this all-inclusive introduction is ideal whether you are working in industry or academia. Theory is linked to practice through discussions of key real-world cases (particle/droplet/bubble coalescence, break-up, nucleation, advection and diffusion and physical- and phase-space), providing valuable experience in simulating systems that can be applied to your own applications. Practical cases of QMOM, DQMOM, CQMOM, EQMOM and ECQMOM are also discussed and compared, as are realizable finite-volume methods. This provides the tools you need to use quadrature-based moment methods, choose from the many available options, and design high-order numerical methods that guarantee realizable moment sets. In addition to the numerous practical examples, MATLAB scripts for several algorithms are also provided, so you can apply the methods described to practical problems straight away.

Intelligent Transport Systems. From Research and Development to the Market Uptake Ana Lúcia Martins,Joao Carlos Ferreira,Alexander Kocian,2020-01-09 This book constitutes the proceedings of the Third EAI International Conference on Intelligent Transport Systems, INTSYS 2019, which was held in Braga, Portugal, in December 2019. The 23 revised full papers were selected from 35 submissions and are organized in four thematic sessions on modelling, optimization, tracking and prediction, visualization and sensing.

An Improved Elastic and Nonelastic Neutron Transport Algorithm for Space Radiation Martha S. Cloudsley,2000 In addition, a high-energy bidirectional neutron source based on a formula by Ranft showed even further improvement of the fluence results over previous results near the front of the water target where diffusion out the front surface is important. Effects of improved interaction cross sections are modest compared with the addition of the high-energy bidirectional source terms.

Regulation of Commercial Space Transport Ruwantissa Abeyratne,2014-11-13 This book provides a look at the various nuances of the commercial aspects of space transport and offers a workable and practical legal and regulatory approach to be taken by the International Civil Aviation

Organization. The book also addresses the perceived lack of wisdom in neglecting to consider the basic legal structure of a regulatory regime for commercial space transport as a first step and goes on to analyze ways and means of using the existing legal instruments pertaining to international civil aviation as an analogous system that can be moulded into a separate and cohesive set of multilateral legal instruments that could apply to commercial space transport. As expected, commercial space transport has taken off with a flourish. It is now evident that, from sub-orbital flights to mining asteroids, this industry will grow exponentially. Signs of its importance are reflected by various international conferences being convened on the subject both by academia and the international community. The only snag is the lack of a regulatory instrument or in the least a contrived approach to a definitive legal regime that would provide a structure, purpose and direction to commercial space transport. This blatant lacuna and neglect has resulted in the emergence of various theories by academics and a half hearted look at the subject by the international legal community.

Modeling and Computational Methods for Kinetic Equations Pierre Degond,Lorenzo Pareschi,Giovanni Russo,2012-12-06 In recent years kinetic theory has developed in many areas of the physical sciences and engineering, and has extended the borders of its traditional fields of application. This monograph is a self-contained presentation of such recently developed aspects of kinetic theory, as well as a comprehensive account of the fundamentals of the theory. Emphasizing modeling techniques and numerical methods, the book provides a unified treatment of kinetic equations not found in more focused works. Specific applications presented include plasma kinetic models, traffic flow models, granular media models, and coagulation-fragmentation problems. The work may be used for self-study, as a reference text, or in graduate-level courses in kinetic theory and its applications.
