Gyeorgos Ceres Hatonn

The Impact of Red Light Cameras (automated Enforcement) on Safety in Arizona Simon Washington, 2005 Red Light Cameras (RLCs) have been used in a number of U.S. cities to yield a demonstrable reduction in red light violations; however, evaluating their impact on safety (crashes) has been relatively more difficult. Accurately estimating the safety impacts of RLCs is challenging for several reasons. First, many safety related factors are uncontrolled and/or confounded during the periods of observation. Second, spillover effects caused by drivers reacting to non-RLC-equipped intersections and approaches can make the selection of comparison sites difficult. Third, sites selected for RLC installation may not be randomly selected, and as a result may suffer from the regression to the mean effect. Finally, crash severity needs to be considered to fully understand the safety impacts of RLCs. With these challenges in mind this study was designed to estimate the safety impacts of RLCs on traffic crashes at signalized intersections in the state of Arizona and to identify which factors are associated with successful installations. RLC equipped intersections in the cities of Phoenix and Scottsdale are examined in detail to draw conclusions as to the relative success of RLC programs in these two jurisdictions. Both jurisdictions are operating successful installations of RLCs. Factors related to RLC effectiveness appear to include crash type and severity, left-turn phasing, presence of warning

signs, approach speeds, and signal timing. Recommendations are made as to under what conditions should RLCs be considered.

**Photographic Enforcement of Traffic Laws** Robert R. Blackburn,Daniel T. Gilbert,National Cooperative Highway Research Program,1995 This synthesis will be of interest to state and local highway agency administrative and executive officers, enforcement agency personnel, attorneys, traffic engineers, and others concerned with managing and enforcing traffic laws at all levels of government. It will also be of interest to manufacturers and marketers of automated speed enforcement (ASE) technology. The synthesis describes the requirements, applications, effectiveness, and issues related to the use of ASE technology. This report of the Transportation

Research Board describes the various types of ASE technology as applied in several localities, including descriptions of operational requirements and performance characteristics of these technologies. The synthesis also discusses how citations are processed, and examines the legal and acceptability issues related to ASE technology and public views on these actions. The various technologies on the market at the time of preparation of this synthesis are also described. It should be noted that, as with any application of public surveillance technology, officials are well advised to exercise proper cautions when employing such enforcement procedures.

*How to Safety Rate Red Light Cameras* Donald S. Sawicki, 2011-05-01 Many communities use red light cameras as a revenue source, then claim it is for safety. Some places go so far as to shorten the yellow duration forcing more drivers to run the light (more revenue, less safety and harder braking). To make matters worse many states use an unrealistic (fast) driver reaction time to determine yellow light duration. A way to safety rate a traffic stoplight (including red light cameras) is to determine potential maximum driver braking. Using a realistic driver reaction time, a realistic (objective and predictable) braking number can be determined. Using a braking g's scale (deceleration compared to acceleration due to gravity), braking g's can be used to determine (braking) safety and comparing other stoplights. *How To Safety Rate Red Light Cameras* explains how to determine braking g's using speed limit, yellow light duration, road grade (incline), and stop bar

to clear point (usually intersection) distance. Includes a discussion of factors involved, mathematical model and proof, equations, and braking scale levels. Lookup tables (English and Metric) provided for quickly estimating braking g's. Are Stoplights in your community safe -- this book will show you how to objectively and clearly rate a stoplight.

*Technical Evaluation of Photo Speed Enforcement for Freeways* Craig A. Roberts, 2005 Extreme speeding on urban-area freeways contributes to increased crashes resulting in fatalities, property damage, and increased maintenance and public safety costs. Photo speed enforcement systems (speed cameras) that automatically sense a speeding vehicle and photograph it and its driver have proven effective at reducing speeding violations, primarily on city streets and arterials. The use of this technology on high-volume, high-speed, multi-lane freeways is technically much more challenging, and largely untested. This research investigates if the current offerings of vendors can provide a viable technical solution in this freeway environment. Twelve ideal characteristics were established that are needed for a speed camera system to operate on Phoenix, Arizona, metro-area freeways. Six vendors were interviewed. Thirteen agencies that use speed camera systems were interviewed, although none were found with sufficient freeway operating experience to provide definitive information to design a field trial. Therefore, only a conceptual field trial and accompanying test plan were developed to explore the technical aspects of

potential systems. Public opinion and countermeasures on speed camera systems were researched and reported. No current vendor offering meets all of the twelve ideal characteristics that were established. Advancements in speed camera systems continue, and it is logical to predict that they can be met in the future. One new technology that shows promise is point-to-point, which tracks average speed between two points on a roadway. This research did not address the violation processing and management activities, but noted that these must be addressed before a field trial can proceed.

**Fundamentals of Connected and Automated Vehicles** Jeffrey Wishart,Yan Chen,Steven Como,Narayanan Kidambi,Duo Lu,Yezhou Yang,2022-01-20 The automotive industry is transforming to a greater degree that has occurred since Henry Ford introduced mass production of the automobile with the Model T in 1913. Advances in computing, data processing, and artificial intelligence (deep learning in particular) are driving the development of new levels of automation that will impact all aspects of our lives including our vehicles. What are Connected and Automated Vehicles (CAVs)? What are the underlying technologies that need to mature and converge for them to be widely deployed? Fundamentals of Connected and Automated Vehicles is written to

answer these questions, educating the reader with the information required to make informed predictions of how and when CAVs will impact their lives. Topics covered include: History of Connected and Automated Vehicles, Localization, Connectivity, Sensor and Actuator Hardware, Computer Vision, Sensor Fusion, Path Planning and Motion Control, Verification and Validation, and Outlook for future of CAVs.

*Red Light Camera Systems* Cynthia Munoz, 2015 Red light running is one of the major causes of crashes, deaths, and injuries at signalised intersections. The Federal Highway Administration (FHWA) and National Highway Traffic Safety Administration (NHTSA) support a comprehensive approach to intersection safety that incorporates engineering, education, and enforcement countermeasures to prevent red light running and improve intersection safety. Red light cameras can be a very effective countermeasure to prevent red light running. There are a number of studies that indicate reduction in crashes at signalised intersections due to red light cameras. The fundamental objective of the research in this book is to determine the effectiveness of RLC systems in reducing crashes. A description of all project efforts is described in this book.

Evaluation of the City of Scottsdale Loop 101 Photo Enforcement Demonstration Program Simon Washington, 2007 Speeding is recognized as one of the most important factors causing traffic crashes. In 2005, 30% of all fatal crashes were speeding-related (National Highway Traffic Safety Administration 2005). According to NHTSA, the cost

of speed-related crashes is estimated to be \$40.4 billion per year (National Highway Traffic Safety Administration 2005). Intelligent Transportation Systems (ITS) now exist to reduce speeding-related crashes by enforcing speed limits with camera-based technologies. These enforcement technologies are generically called speed cameras and have been effective on municipal streets and arterials in Arizona. The City of Scottsdale began automated enforcement efforts in December of 1996. On October 25, 2005, the Scottsdale City Council approved the nine-month speed enforcement camera demonstration program on a 7.8-mile stretch of the SR 101 segment within Scottsdale. The speed enforcement program (SEP) began on January 22, 2006 and ended on October 23, 2006. The demonstration program on the SR 101 freeway segment in Scottsdale is the first use of the fixed-site photo enforcement equipment on a freeway in Arizona and is believed to be the first in the nation. This study was conducted to estimate the impact of the SEP on traffic safety, speed, speeding behavior, and daily travel time uncertainty. More specifically, the objectives were to estimate: the impact of the SEP on speeding behavior; the changes in mean speed due to the SEP; the impact of the SEP on traffic safety in the enforcement zone; the total travel time impacts; and the economic impacts of the safety effects.
